1. System and memory architecture

The devices of GD32VF103 series devices are 32-bit general-purpose microcontrollers based on the Nuclei Bumblebee processor. The Bumblebee processor is based on the RSIC-V architecture instruction set, hereinafter referred to as the RISC-V processor. The RISC-V processor includes three AHB buses known as I-Code bus, D-Code bus and System buse. All memory accesses of the RISC-V processor are executed on the three buses according to the different purposes and the target memory spaces. The memory organization uses a Harvard architecture, pre-defined memory map and up to 4 GB of memory space, making the system flexible and extendable.

1.1. RISC-V CPU

RISC-V CPU target for embedded applications that require low energy consumption and small area, which is compliant to RISC-V architecture with several efficient micro-architecture features, including simple dynamic branch prediction, instruction pre-fetch buffers and local memories. Visit **https://github.com/nucleisys/Bumblebee_Core_Doc** for more information about the Bumblebee core.It supports 32 general purpose registers (GPRs) and fast multiplier for performance/area tradeoff:

- RISC-V compliant little-endian RV32IMAC (32GPRs) ;
- Configurable 2-stage pipeline optimized for low gate-count and high frequency;
- Machine (M) and User (U) Privilege levels support;
- Single-cycle hardware multiplier and Multi-cycles hardware divider support;
- Misaligned load/store hardware support;
- Atomic instructions hardware support;
- Non-maskable interrupt (NMI) support;
- Dynamic Branch Prediction and instruction pre-fetch buffers to speed up control code;
- State-of-the-art micro-architecture design to tradeoff area and performance requirements;
- WFI (Wait for Interrupt) support;
- WFE (Wait for Event) support;
- Interrupt priority levels configurable and programmable;
- Enhancement of vectored interrupt handling for real-time performance;
- Support interrupt preemption with priority ;
- Support interrupt tail chaining;
- Standard 4-wire JTAG debug port
- Support interactive debug functionalities
- Support 4 triggers for hardware breakpoint

1.2. System architecture

A 32-bit multilayer bus is implemented in the GD32VF103 devices, which makes the parallel access paths between multiple masters and slaves in the system possible The multilayer bus consists of an AHB interconnect matrix, one AHB bus and two APB buses. The interconnection relationship of the AHB interconnect matrix is shown below. In ***Table 1-1. The interconnection relationship of the AHB interconnect matrix***, "1" indicates the corresponding master is able to access the corresponding slave through the AHB interconnect matrix, the blank indicates the corresponding master cannot access the corresponding slave through the AHB interconnect matrix.

Table 1-1. The interconnection relationship of the AHB interconnect matrix

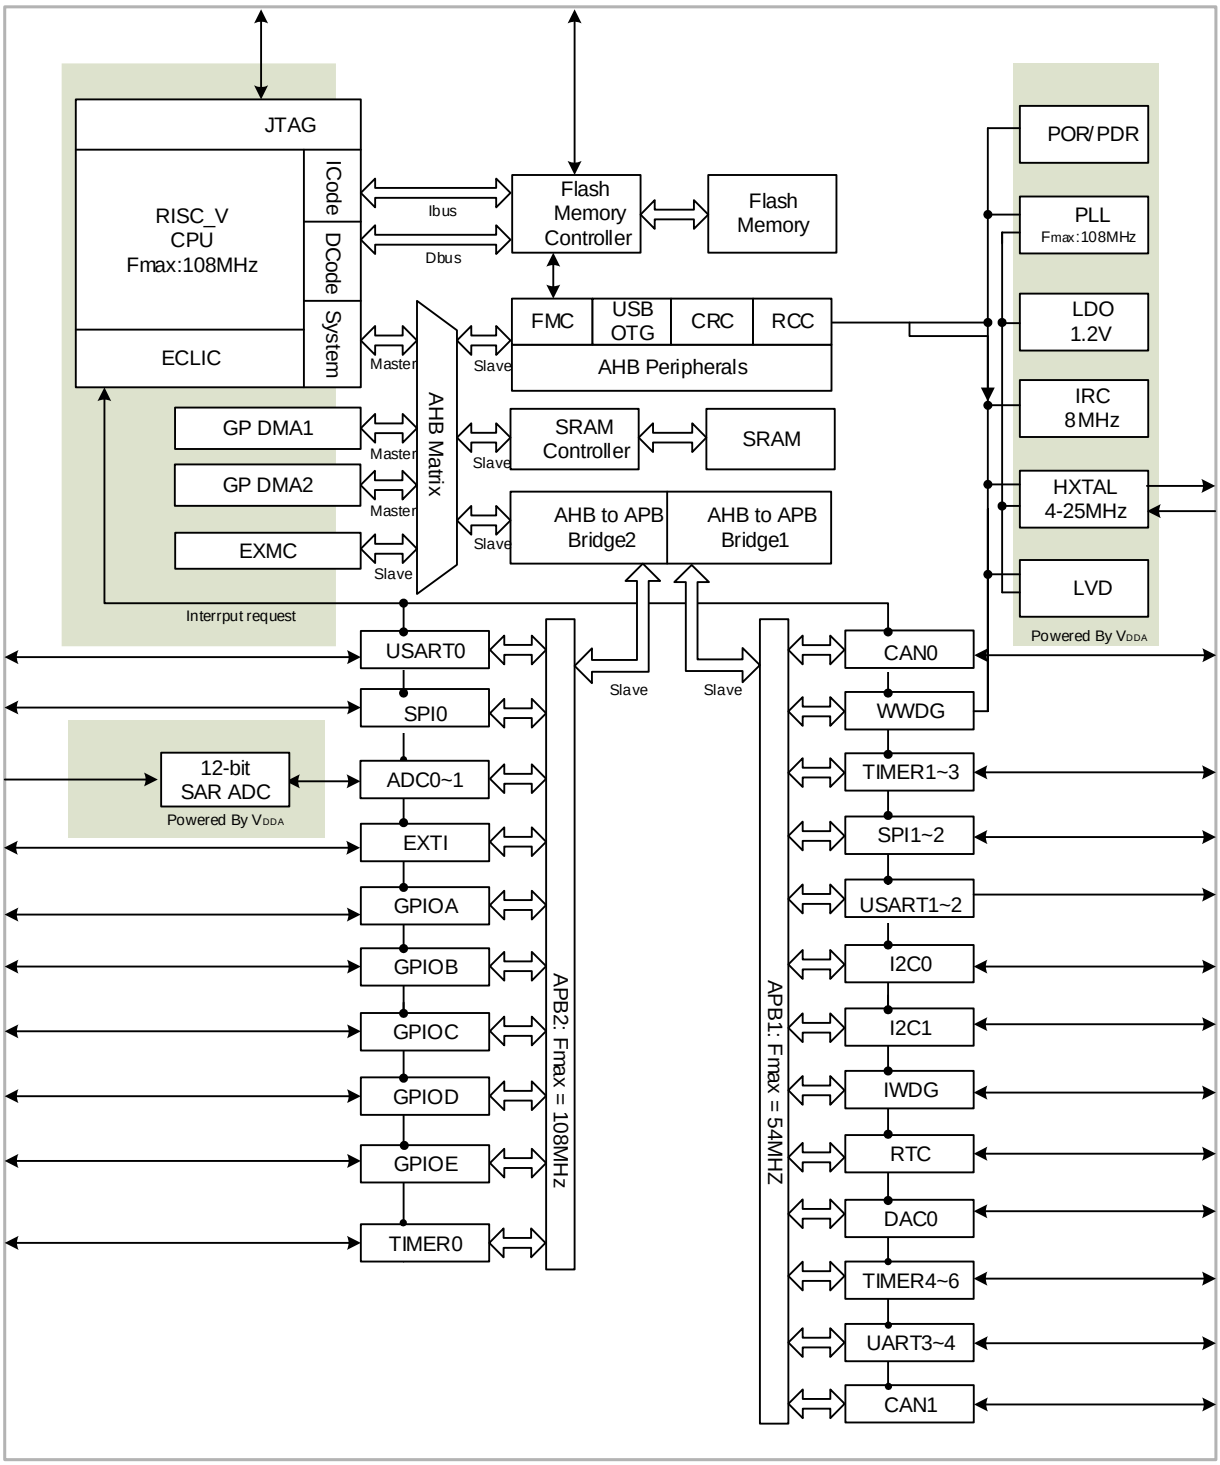
	IBUS	DBUS	SBUS	DMA0	DMA1
FMC-I	1				
FMC-D		1		1	1
SRAM	1	1	1	1	1
EXMC	1	1	1	1	1
AHB			1	1	1
APB1			1	1	1
APB2			1	1	1

As is shown above, there are several masters connected with the AHB interconnect matrix, including IBUS, DBUS, SBUS, DMA0 and DMA1. IBUS is the instruction bus of the RISC-V core, which is used for fetching instruction/vector from the Code region (0x0000 0000 ~ 0x1FFF FFFF). DBUS is the data bus of the RISC-V core, which is used for loading/storing data and also for debugging access of the Code region. Similarly, SBUS is the system bus of the RISC-V core, which is used for fetching instruction/vector, loading/storing data and debugging access of the system regions. The System regions include the internal SRAM region and the Peripheral region. DMA0 and DMA1 are the buses of DMA0 and DMA1 respectively.

There are also several slaves connected with the AHB interconnect matrix, including FMC-I, FMC-D, SRAM, EXMC, AHB, APB1 and APB2. FMC-I is the instruction bus of the flash memory controller, FMC-D is the data bus of the flash memory controller. SRAM is on-chip static random access memories. EXMC is the external memory controller. AHB is the AHB bus connected with all AHB slaves, APB1 and APB2 connected with all APB slaves and all APB peripherals. APB1 is limited to 54 MHz, APB2 operates at full speed (up to 108MHz depending on the device).

As shown in the following figure, these are interconnected using the multilayer AHB bus architecture.

Figure 1-1. GD32VF103 system architecture



1.3. Memory map

The RISC-V processor is structured using a Harvard architecture which uses separate buses to fetch instructions and load/store data. The instruction code and data are both located in the same memory address space but in different address ranges. Program memory, data memory,

registers and I/O ports are organized within the same linear 4-Gbyte address space. The maximum address range of the RISC-V is 4-Gbyte due to its 32-bit bus address width. Additionally, a pre-defined memory map is provided by the RISC-V processor to reduce the software complexity of repeated implementation for different device vendors. In the map, some regions are used by the RISC-V system peripherals which can not be modified. However, the other regions are available to the vendors. ***Table 1-2. Memory map of GD32VF103 devices*** shows the memory map of the GD32VF103 series devices, including Code, SRAM, peripheral, and other pre-defined regions. Almost each peripheral is allocated 1KB of space. This allows simplifying the address decoding for each peripheral.

Table 1-2. Memory map of GD32VF103 devices

Pre-defined Regions	Bus	Address	Peripherals
External device	AHB	0xA000 0000 - 0xA000 0FFF	EXMC - SWREG

1.3.1. On-chip SRAM memory

The GD32VF103 series of devices contain up to 32 KB of on-chip SRAM which address starts at 0x2000 0000. It supports byte, half-word (16 bits), and word (32 bits) accesses.

1.3.2. On-chip flash memory overview

The devices provide high density on-chip flash memory, which is organized as follows:

- Up to 128KB of main flash memory.
- Up to 18KB of information blocks for the boot loader.
- Option bytes to configure the device.

Refer to ***Flash memory controller (FMC)*** Chapter for more details.

1.4. Boot configuration

The GD32VF103 devices provide three kinds of boot sources which can be selected by the BOOT0 and BOOT1 pins. The details are shown in the following table. The value on the two

pins is latched on the 4th rising edge of CK_SYS after a reset. User can select the required boot source by set the BOOT0 and BOOT1 pins after a power-on reset or a system reset. Once the two pins have been sampled, they are free and can be used for other purposes.

Table 1-3. Boot modes

Selected boot source	Boot mode selection pins	
	Boot1	Boot0
Main Flash Memory	x	0
Boot loader	0	1
On-chip SRAM	1	1

Note: When the boot source is hoped to be set as "Main Flash Memory", the Boot0 pin has to be connected with GND definitely and can not be floating.

The embedded boot loader is located in the System memory, which is used to reprogram the Flash memory. In GD32VF103 devices, the boot loader can be activated through the USART0 (PA9 and PA10), USART1 (PD5 and PD6), USBFS in device mode (PA9, PA11 and PA12) interface.

1.5. Device electronic signature

The device electronic signature contains memory size information and the 96-bit unique device ID. It is stored in the information block of the Flash memory. The 96-bit unique device ID is unique for any device. It can be used as serial numbers, or part of security keys, etc.

1.5.1. Memory density information

Base address: 0x1FFF F7E0

The value is factory programmed and can never be altered by user.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:0	UNIQUE_ID[95:64]	Unique device ID

2. Flash memory controller (FMC)

2.1. Overview

The flash memory controller, FMC, provides all the necessary functions for the on-chip flash memory. There is no waiting time while CPU executes instructions stored in the flash. It also provides page erase, mass erase, and word/half-word program operations for flash memory.

2.2. Characteristics

- Up to 128KB of on-chip flash memory for instruction and data.
- No waiting time when CPU executes instructions.
- The flash page size is 1KB for all series.
- Word/half-word programming, page erase and mass erase operation.
- 16B option bytes block for user application requirements.
- Option bytes are uploaded to the option byte control registers on every system reset.
- Flash security protection to prevent illegal code/data access.
- Page erase/program protection to prevent unexpected operation.

2.3. Function overview

2.3.1. Flash memory architecture

The flash memory consists of up to 128 KB main flash organized into 128 pages with 1 KB capacity per page and a 18 KB Information Block for the Boot Loader. The main flash memory contains a total of up to 128 pages which can be erased individually. The ***Table 2-1. Base address and size for flash memory*** shows the details of flash organization.

Table 2-1. Base address and size for flash memory

Block	Name	Address Range	size (bytes)
Main Flash Block	Page 0	0x0800 0000 - 0x0800 03FF	1KB
	Page 1	0x0800 0400 - 0x0800 07FF	1KB
	Page 2	0x0800 0800 - 0x0800 0BFF	1KB
	…	…	…
	Page 127	0x0801 FC00 - 0x0801 FFFF	1KB
Information Block	Boot loader area	0x1FFF B000- 0x1FFF F7FF	18KB
Option bytes Block	Option bytes	0x1FFF F800 - 0x1FFF F80F	16B

Note: The Information Block stores the boot loader. This block cannot be programmed or erased by user.

2.3.2. Read operations

The flash can be addressed directly as a common memory space. Any instruction fetch and the data access from the flash are through the IBUS or DBUS from the CPU.

2.3.3. Unlock the FMC_CTL registers

After reset, the FMC_CTL registers are not accessible in write mode, and the LK bit in FMC_CTL register is 1. An unlocking sequence consists of two write operations to the FMC_KEY register to open the access to the FMC_CTL register. The two write operations are writing 0x45670123 and 0xCDEF89AB to the FMC_KEY register. After the two write operations, the LK bit in FMC_CTL register is reset to 0 by hardware. The software can lock the FMC_CTL again by setting the LK bit in FMC_CTL register to 1. Any wrong operations to the FMC_KEY will set the LK bit to 1, and lock FMC_CTL register, and lead to a bus error.

The OBPG bit and OBER bit in FMC_CTL are still protected even the FMC_CTL is unlocked. The unlocking sequence is two write operations, which are writing 0x45670123 and 0xCDEF89AB to FMC_OBKEY register. And then the hardware sets the OBWEN bit in FMC_CTL register to 1. The software can reset OBWEN bit to 0 to protect the OBPG bit and OBER bit in FMC_CTL register again.

2.3.4. Page erase

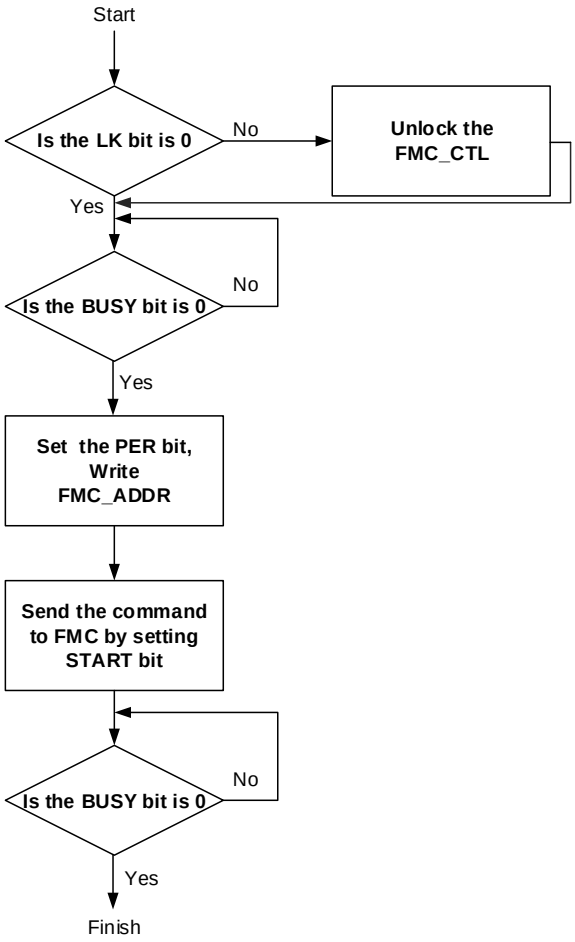
The FMC provides a page erase function which is used to initialize the contents of a main flash memory page to a high state. Each page can be erased independently without affecting the contents of other pages. The following steps show the access sequence of the registers for a page erase operation.

- Unlock the FMC_CTL registers if necessary.
- Check the BUSY bit in FMC_STAT registers to confirm that no flash memory operation is in progress (BUSY equals to 0). Otherwise, wait until the operation has finished.
- Set the PER bit in FMC_CTL registers.
- Write the page absolute address (0x08XX XXXX) into the FMC_ADDR registers.
- Send the page erase command to the FMC by setting the START bit in FMC_CTL registers.
- Wait until all the operations have finished by checking the value of the BUSY bit in FMC_STAT registers.
- Read and verify the page if required using a DBUS access.

When the operation is executed successfully, the ENDF in FMC_STAT registers is set, and an interrupt will be triggered by FMC if the ENDIE bit in the FMC_CTL registers is set. Note that a correct target page address must be confirmed. Or the software may run out of control

if the target erase page is being used to fetch codes or to access data. The FMC will not provide any notification when this occurs. Additionally, the page erase operation will be ignored on erase/program protected pages. In this condition, a flash operation error interrupt will be triggered by the FMC if the ERRIE bit in the FMC_CTL registers is set. The software can check the WPERR bit in the FMC_STAT registers to detect this condition in the interrupt handler. ***Figure 2-1. Process of page erase operation*** shows the page erase operation flow.

Figure 2-1. Process of page erase operation



2.3.5. Mass erase

The FMC provides a complete erase function which is used to initialize the main flash block contents. This erase can affect by setting MER bit to 1 in the FMC_CTL register. The following steps show the mass erase register access sequence.

- Unlock the FMC_CTL registers if necessary.
- Check the BUSY bit in FMC_STAT registers to confirm that no flash memory operation is in progress (BUSY equals to 0). Otherwise, wait until the operation has finished.
- Set MER bit in FMC_CTL register
- Send the mass erase command to the FMC by setting the START bit in FMC_CTL

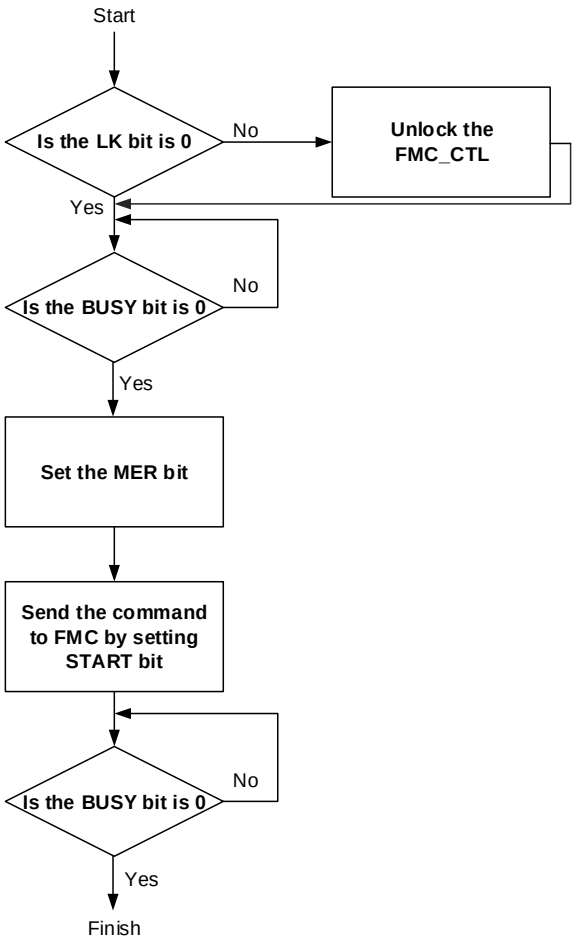
registers.

- Wait until all the operations have been finished by checking the value of the BUSY bit in FMC_STAT registers.
- Read and verify the flash memory if required using a DBUS access.

When the operation is executed successfully, the ENDF in FMC_STAT registers is set, and an interrupt will be triggered by FMC if the ENDIE bit in the FMC_CTL registers is set. Since all flash data will be modified to a value of 0xFFFF_FFFF, the mass erase operation can be implemented using a program that runs in SRAM or by using the debugging tool that accesses the FMC registers directly.

The following figure indicates the mass erase operation flow.

Figure 2-2. Process of mass erase operation



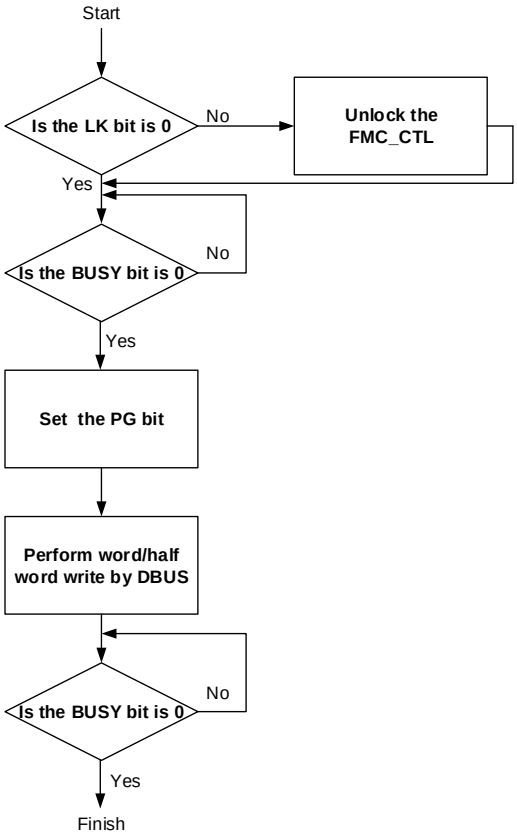
2.3.6. Main flash programming

The FMC provides a 32-bit word/16-bit half word programming function which is used to modify the main flash memory contents. The following steps show the register access sequence of the word programming operation.

- Unlock the FMC_CTL registers if necessary.
- Check the BUSY bit in FMC_STAT registers to confirm that no flash memory operation is in progress (BUSY equals to 0). Otherwise, wait until the operation has finished.
- Set the PG bit in FMC_CTL registers.
- Write a 32-bit word/16-bit half word to desired absolute address (0x08XX XXXX) by DBUS.
- Wait until all the operations have been finished by checking the value of the BUSY bit in FMC_STAT registers.
- Read and verify the Flash memory if required using a DBUS access.

When the operation is executed successfully, the ENDF in FMC_STAT registers is set, and an interrupt will be triggered by FMC if the ENDIE bit in the FMC_CTL registers is set. Note that the word/half word programming operation checks the address if it has been erased. If the address has not been erased, PGERR bit in the FMC_STAT registers will be set when programming the address except 0x0. Note that the PG bit must be set before the word/half word programming operation. Additionally, the program operation will be ignored on erase/program protected pages and WPERR bit in FMC_STAT is set. In these conditions, a flash operation error interrupt will be triggered by the FMC if the ERRIE bit in the FMC_CTL registers is set. The software can check the PGERR bit or WPERR bit in the FMC_STAT registers to detect which condition occurred in the interrupt handler. ***Figure 2-3. Process of word program operation*** displays the word programming operation flow.

Figure 2-3. Process of word program operation



Note: Reading the flash should be avoided when a program/erase operation is ongoing in the same bank. And flash memory accesses failed if the CPU enters the power saving modes.

2.3.7. Option bytes Erase

The FMC provides an erase function which is used to initialize the option bytes block in flash. The following steps show the erase sequence.

- Unlock the FMC_CTL register if necessary.
- Check the BUSY bit in FMC_STAT register to confirm that no Flash memory operation is in progress (BUSY equal to 0). Otherwise, wait until the operation has finished.
- Unlock the option bytes operation bits in FMC_CTL register if necessary.
- Wait until OBWEN bit is set in FMC_CTL register.
- Set OBER bit in FMC_CTL register.
- Send the option bytes erase command to the FMC by setting the START bit in FMC_CTL register.
- Wait until all the operations have been finished by checking the value of the BUSY bit in FMC_STAT register.
- Read and verify the Flash memory if required using a DBUS access.

When the operation is executed successful, the ENDF in FMC_STAT register is set, and an interrupt will be triggered by FMC if the ENDIE bit in the FMC_CTL register is set.

2.3.8. Option bytes modify

The FMC provides an erase and then program function which is used to modify the option bytes block in flash. There are 8 pair option bytes. The MSB is the complement of the LSB in each pair. And when the option bytes are modified, the MSB is generated by FMC automatically, not the value of input data. The following steps show the erase sequence.

- Unlock the FMC_CTL register if necessary.
- Check the BUSY bit in FMC_STAT register to confirm that no Flash memory operation is in progress (BUSY equals to 0). Otherwise, wait until the operation has finished.
- Unlock the option bytes operation bits in FMC_CTL register if necessary.
- Wait until OBWEN bit is set in FMC_CTL register.
- Set the OBPG bit in FMC_CTL register.
- A 32-bit word/16-bit half word write at desired address by DBUS.
- Wait until all the operations have been finished by checking the value of the BUSY bit in FMC_STAT register.
- Read and verify the Flash memory if required using a DBUS access.

When the operation is executed successfully, the ENDF in FMC_STAT register is set, and an interrupt will be triggered by FMC if the ENDIE bit in the FMC_CTL register is set. Note that the word/half word programming operation checks the address if it has been erased. If the address has not been erased, PGERR bit in the FMC_STAT register will set when program the address except programming 0x0.

The modified option bytes only take effect after a system reset is generated.

2.3.9. Option bytes description

The option bytes block is reloaded to FMC_OBSTAT and FMC_WP registers after each system reset, and the option bytes take effect. The complement option bytes are the opposite of option bytes. When option bytes reload, if the complement option byte and option byte do not match, the OBERR bit in FMC_OBSTAT register is set, and the option byte is set to 0xFF. The OBERR bit is not set if both the option byte and its complement byte are 0xFF. ***Table 2-2. Option byte*** shows the detail of option bytes.

Table 2-2. Option byte

Address	Name	Description
0x1fff f800	SPC	option byte Security Protection value 0xA5 : no security protection any value except 0xA5 : under security protection
0x1fff f801	SPC_N	SPC complement value
0x1fff f802	USER	[7:4]: reserved

Address	Name	Description
		[3]: BB 0: boot from bank1 or bank0 if bank1 is void, when configured boot from main memory 1: boot from bank0, when configured boot from main memory [2]: nRST_STDBY 0: generate a reset instead of entering standby mode 1: no reset when entering standby mode [1]: nRST_DPSLP 0: generate a reset instead of entering Deep-sleep mode 1: no reset when entering Deep-sleep mode [0]: nWDG_HW 0: hardware free watchdog 1: software free watchdog
0x1fff f803	USER_N	USER complement value
0x1fff f804	DATA[7:0]	user defined data bit 7 to 0
0x1fff f805	DATA_N[7:0]	DATA complement value bit 7 to 0
0x1fff f806	DATA[15:8]	user defined data bit 15 to 8
0x1fff f807	DATA_N[15:8]	DATA complement value bit 15 to 8
0x1fff f808	WP[7:0]	Page Erase/Program Protection bit 7 to 0 0: protection active 1: unprotected
0x1fff f809	WP_N[7:0]	WP complement value bit 7 to 0
0x1fff f80a	WP[15:8]	Page Erase/Program Protection bit 15 to 8
0x1fff f80b	WP_N[15:8]	WP complement value bit 15 to 8
0x1fff f80c	WP[23:16]	Page Erase/Program Protection bit 23 to 16
0x1fff f80d	WP_N[23:16]	WP complement value bit 23 to 16
0x1fff f80e	WP[31:24]	Page Erase/Program Protection bit 31 to 24 WP[30:24]: Each bit is related to 4KB flash protection, that means 4 pages for GD32VF103. Bit 0 configures the first 4KB flash protection, and so on.
0x1fff f80f	WP_N[31:24]	WP complement value bit 31 to 24

2.3.10. Page erase/program protection

The FMC provides page erase/program protection functions to prevent inadvertent operations on the Flash memory. The page erase or program will not be accepted by the FMC on protected pages. If the page erase or program command is sent to the FMC on a protected page, the WPERR bit in the FMC_STAT registers will then be set by the FMC. If the WPERR bit is set and the ERRIE bit is also set to 1 to enable the corresponding interrupt, then the Flash operation error interrupt will be triggered by the FMC to draw the attention of the CPU. The page protection function can be individually enabled by configuring the WP [31:0] bit field

to 0 in the option bytes. If a page erase operation is executed on the option bytes block, all the Flash Memory page protection functions will be disabled. When WP in the option bytes is modified, a system reset followed is necessary.

2.3.11. Security protection

The FMC provides a security protection function to prevent illegal code/data access on the Flash memory. This function is useful for protecting the software/firmware from illegal users.

No protection: when setting SPC byte and its complement value to 0x5AA5, no protection performed. The main flash and option bytes block are accessible by all operations.

Under protection: when setting SPC byte and its complement value to any value except 0x5AA5, the security protection is performed. Note that a power reset should be followed instead of a system reset if the SPC modification is performed while the debug module is still connected to JTAG device. Under the security protection, the main flash can only be accessed by user code and the first 4KB flash is under erase/program protection. In debug mode, boot from SRAM or boot from boot loader mode, all operations to main flash is forbidden. If a read operation to main flash in debug, boot from SRAM or boot from boot loader mode, a bus error will be generated. If a program/erase operation to main flash in debug mode, boot from SRAM or boot from boot loader mode, the WPERR bit in FMC_STAT registers will be set. Option bytes block are accessible by all operations, which can be used to disable the security protection. If program back to no protection level by setting SPC byte and its complement value to 0x5AA5, a mass erase for main flash will be performed.

2.4. Register definition

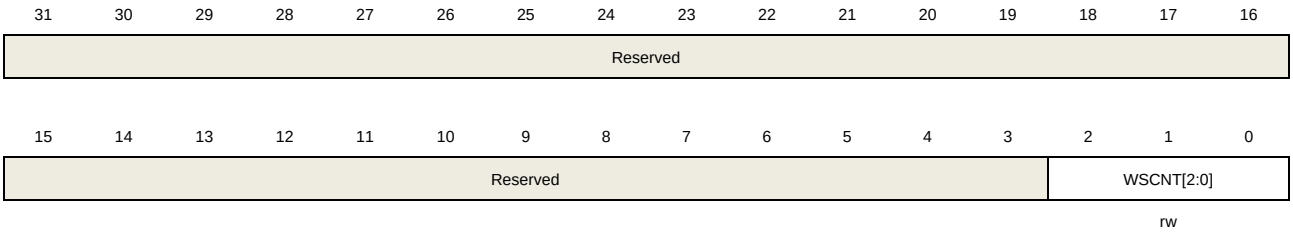
FMC base address: 0x4002 2000

2.4.1. Wait state register (FMC_WS)

Address offset: 0x00

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



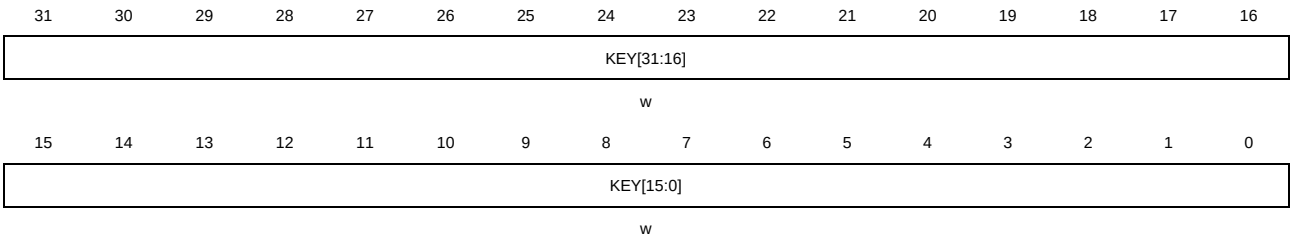
Bits	Fields	Descriptions
31:3	Reserved	Must be kept at reset value.
2:0	WSCNT[2:0]	Wait state counter These bits is set and reset by software. The WSCNT valid when WSEN bit in FMC_WSEN is set. 000: 0 wait state added 001: 1 wait state added 010: 2 wait state added 011~111:reserved

2.4.2. Unlock key register (FMC_KEY)

Address offset: 0x04

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:0	KEY[31:0]	FMC_CTL unlock key These bits are only be written by software. Write KEY[31:0] with keys to unlock FMC_CTL register

2.4.3. Option byte unlock key register (FMC_OBKEY)

Address offset: 0x08

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OBKEY[31:16]															
w															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OBKEY[15:0]															
w															

Bits	Fields	Descriptions
31:0	OBKEY[31:0]	FMC_CTL option bytes operation unlock key These bits are only be written by software. Write OBKEY[31:0] with keys to unlock option bytes command in FMC_CTL register.

2.4.4. Status register (FMC_STAT)

Address offset: 0x0C

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved										ENDF	WPERR	Reserved	PGERR	Reserved	BUSY
										rc_w1	rc_w1		rc_w1		r

Bits	Fields	Descriptions
31:6	Reserved	Must be kept at reset value.
5	ENDF	End of operation flag bit When the operation executed successfully, this bit is set by hardware. The software can clear it by writing 1.
4	WPERR	Erase/Program protection error flag bit

		When erase/program on protected pages, this bit is set by hardware. The software can clear it by writing 1.
3	Reserved	Must be kept at reset value.
2	PGERR	Program error flag bit When program to the flash while it is not 0xFFFF, this bit is set by hardware. The software can clear it by writing 1.
1	Reserved	Must be kept at reset value.
0	BUSY	The flash busy bit When the operation is in progress, this bit is set to 1. When the operation is end or an error is generated, this bit is cleared.

2.4.5. Control register (FMC_CTL)

Address offset: 0x10

Reset value: 0x0000 0080

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved			ENDIE	Reserved	ERRIE	OBWEN	Reserved	LK	START	OBER	OBPG	Reserved	MER	PER	PG
			rw		rw	rw		rs	rs	rw	rw		rw	rw	rw

Bits	Fields	Descriptions
31:13	Reserved	Must be kept at reset value.
12	ENDIE	End of operation interrupt enable bit This bit is set or cleared by software 0: no interrupt generated by hardware. 1: end of operation interrupt enable
11	Reserved	Must be kept at reset value.
10	ERRIE	Error interrupt enable bit This bit is set or cleared by software 0: no interrupt generated by hardware. 1: error interrupt enable
9	OBWEN	Option byte erase/program enable bit This bit is set by hardware when right sequence written to FMC_OBKEY register. This bit can be cleared by software.

8	Reserved	Must be kept at reset value.
7	LK	FMC_CTL lock bit This bit is cleared by hardware when right sequence written to FMC_KEY register. This bit can be set by software.
6	START	Send erase command to FMC bit This bit is set by software to send erase command to FMC. This bit is cleared by hardware when the BUSY bit is cleared.
5	OBER	Option bytes erase command bit This bit is set or clear by software 0: no effect 1: option byte erase command
4	OBPG	Option bytes program command bit This bit is set or clear by software 0: no effect 1: option bytes program command
3	Reserved	Must be kept at reset value.
2	MER	Main flash mass erase for bank0 command bit This bit is set or cleared by software 0: no effect 1: main flash mass erase command for bank0
1	PER	Main flash page erase for bank0 command bit This bit is set or clear by software 0: no effect 1: main flash page erase command for bank0
0	PG	Main flash program for bank0 command bit This bit is set or clear by software 0: no effect 1: main flash program command for bank0

Note: This register should be reset after the corresponding flash operation completed.

2.4.6. Address register (FMC_ADDR)

Address offset: 0x14
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDR[31:16]															
w															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR[15:0]															
w															

Bits	Fields	Descriptions
31:0	ADDR[31:0]	Flash erase/program command address bits These bits are configured by software. ADDR bits are the address of flash erase/program command

2.4.7. Option byte status register (FMC_OBSTAT)

Address offset: 0x1C
Reset value: 0x0XXX XXXX.

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved						DATA[15:6]									
						r									

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[5:0]						USER[7:0]								SPC	OBERR
r						r								r	r

Bits	Fields	Descriptions
31:26	Reserved	Must be kept at reset value.
25:10	DATA[15:0]	Store DATA of option bytes block after system reset.
9:2	USER[7:0]	Store USER of option bytes block after system reset.
1	SPC	Option bytes security protection code 0: no protection 1: protection
0	OBERR	Option bytes read error bit. This bit is set by hardware when the option bytes and its complement byte do not match, then the option bytes is set to 0xFF.

2.4.8. Erase/Program Protection register (FMC_WP)

Address offset: 0x20
Reset value: 0xXXXX XXXX

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WP[31:16]															
r															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WP[1															
r															

Bits	Fields	Descriptions
31:0	WP[31:0]	Store WP of option bytes block after system reset

2.4.9. Product ID register (FMC_PID)

Address offset: 0x100

Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PID[31:16]															
r															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PID[15:0]															
r															

Bits	Fields	Descriptions
31:0	PID[31:0]	Product reserved ID code register 0 These bits are read only by software. These bits are unchanged constant after power on. These bits are one time program when the chip produced.

3. Power management unit (PMU)

3.1. Overview

The power consumption is regarded as one of the most important issues for the devices of GD32VF103 series. According to the Power management unit (PMU), provides three types of power saving modes, including Sleep, Deep-sleep and Standby mode. These modes reduce the power consumption and allow the application to achieve the best tradeoff among the conflicting demands of CPU operating time, speed and power consumption. For GD32VF103 devices, there are three power domains, including V_{DD} / V_{DDA} domain, 1.2V domain, and Backup domain, as is shown in ***Figure 3-1. Power supply overview***. The power of the V_{DD} domain is supplied directly by V_{DD}. An embedded LDO in the V_{DD} / V_{DDA} domain is used to supply the 1.2V domain power. A power switch is implemented for the Backup domain. It can be powered from the V_{BAT} voltage when the main V_{DD} supply is shut down.

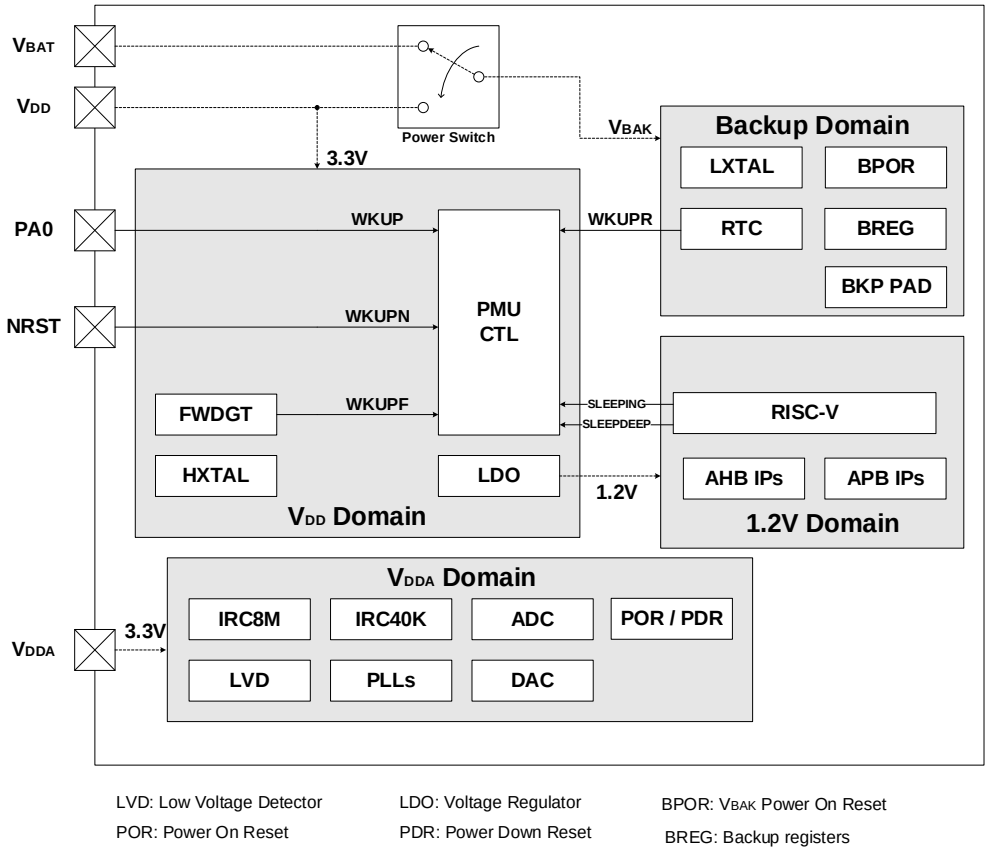
3.2. Characteristics

- Three power domains: V_{BAK}, V_{DD} / V_{DDA} and 1.2V power domains.
- Three power saving modes: Sleep, Deep-sleep and Standby modes.
- Internal Voltage regulator (LDO) supplies around 1.2V voltage source for 1.2V domain.
- Low Voltage Detector(LVD) can issue an interrupt or event when the power is lower than a programmed threshold.
- Battery power (V_{BAT}) for Backup domain when V_{DD} is shut down.

3.3. Function overview

Figure 3-1. Power supply overview provides details on the internal configuration of the PMU and the relevant power domains.

Figure 3-1. Power supply overview



3.3.1. Battery backup domain

The Backup domain is powered by the V_{DD} or the battery power source (V_{BAT}) selected by the internal power switch, and the V_{BAK} pin which drives Backup Domain, supplies power for RTC unit, LXTAL oscillator, BPOR and BREG，and three BKP PAD including PC13 to PC15. In order to ensure the content of the Backup domain registers and the RTC supply, when V_{DD} supply is shut down, V_{BAT} pin can be connected to an optional standby voltage supplied by a battery or by another source. The power switch is controlled by the Power Down Reset circuit in the V_{DD} / V_{DDA} domain. If no external battery is used in the application, it is recommended to connect V_{BAT} pin externally to V_{DD} pin with a 100nF external ceramic decoupling capacitor.

The Backup domain reset sources include the Backup domain power-on-reset (BPOR) and the Backup Domain software reset. The BPOR signal forces the device to stay in the reset mode until V_{BAK} is completely powered up. Also the application software can trigger the Backup domain software reset by setting the BKPRST bit in the RCU_BDCTL register to reset the Backup domain.

The clock source of the Real Time Clock (RTC) circuit can be derived from the Internal 40KHz RC oscillator (IRC40K) or the Low Speed Crystal oscillator (LXTAL), or HXTAL clock divided by 128. When V_{DD} is shut down, only LXTAL is valid for RTC. Before entering the power saving mode by executing the WFI / WFE instruction, the RISC-V can setup the RTC register with an expected wakeup time and enable the wakeup function to achieve the RTC timer wakeup

event. After entering the power saving mode for a certain amount of time, the RTC will wake up the device when the time match event occurs. The details of the RTC configuration and operation will be described in the***Real-time Clock (RTC)***.

When the Backup domain is supplied by V_{DD} (V_{BAK} pin is connected to V_{DD}), the following functions are available:

- PC13 can be used as GPIO or RTC function pin described in the ***Real-time Clock (RTC)***..
- PC14 and PC15 can be used as either GPIO or LXTAL Crystal oscillator pins.

When the Backup domain is supplied by V_{BAT} (V_{BAK} pin is connected to V_{BAT}), the following functions are available:

- PC13 can be used as RTC function pin described in the ***Real-time Clock (RTC)***..
- PC14 and PC15 can be used as LXTAL Crystal oscillator pins only.

Note: Since PC13, PC14, PC15 are supplied through the Power Switch, which can only be obtained by a small current, the speed of GPIOs PC13 to PC15 should not exceed 2MHz when they are in output mode (maximum load: 30pF).

3.3.2. V_{DD} / V_{DDA} power domain

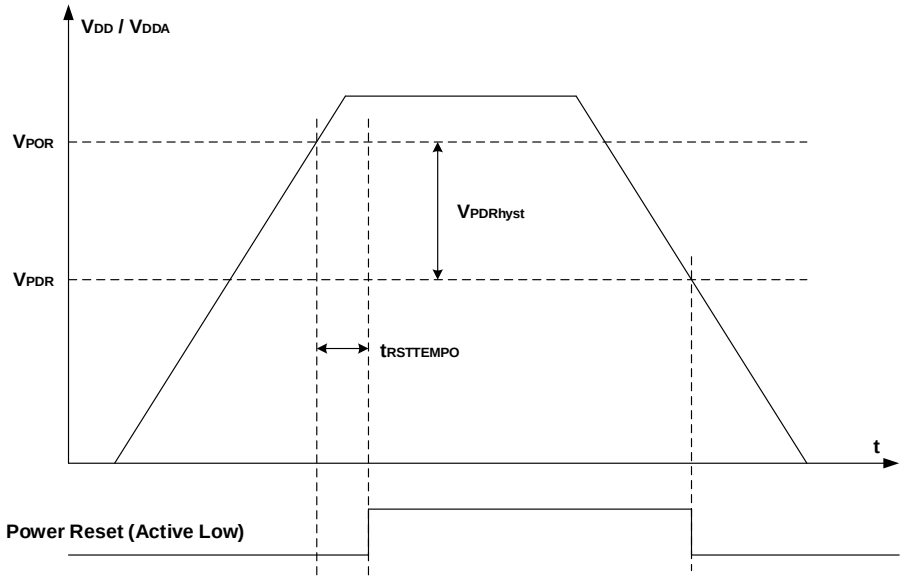
V_{DD} / V_{DDA} domain includes two parts: V_{DD} domain and V_{DDA} domain. V_{DD} domain includes HXTAL (High Speed Crystal oscillator), LDO (Voltage Regulator), POR / PDR (Power On / Down Reset), FWDGT (Free Watchdog Timer), all pads except PC13 / PC14 / PC15, etc. V_{DDA} domain includes ADC / DAC (AD / DA Converter), IRC8M (Internal 8MHz RC oscillator), IRC40K (Internal 40KHz RC oscillator), PLLs (Phase Locking Loop), LVD (Low Voltage Detector), etc.

V_{DD} domain

The LDO, which is implemented to supply power for the 1.2V domain, is always enabled after reset. It can be configured to operate in three different status, including in the Sleep mode (full power on), in the Deep-sleep mode (on or low power), and in the Standby mode (power off).

The POR / PDR circuit is implemented to detect V_{DD} / V_{DDA} and generate the power reset signal which resets the whole chip except the Backup domain when the supply voltage is lower than the specified threshold. ***Figure 3-2. Waveform of the POR / PDR*** shows the relationship between the supply voltage and the power reset signal. V_{POR} represents the threshold of power on reset, V_{PDR} represents the threshold of power down reset, $V_{PDRhyst}$ represents the hysteresis value. Please refer to the datasheet for the values of these parameters.

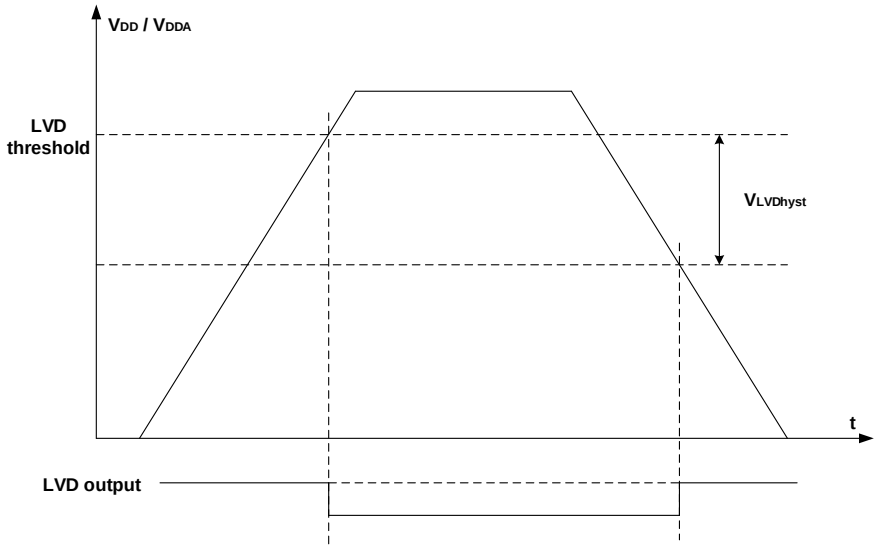
Figure 3-2. Waveform of the POR / PDR



V_{DDA} domain

The LVD is used to detect whether the V_{DD}/V_{DDA} supply voltage is lower than a programmed threshold selected by the LVDT[2:0] bits in the Power control register (PMU_CTL). The LVD is enabled by setting the LVDEN bit, and LVDF bit, which in the Power status register (PMU_CS), indicates if V_{DD} / V_{DDA} is higher or lower than the LVD threshold. This event is internally connected to the EXTI line 16 and can generate an interrupt if it is enabled through the EXTI registers. ***Figure 3-3. Waveform of the LVD threshold*** shows the relationship between the LVD threshold and the LVD output (LVD interrupt signal depends on EXTI line 16 rising or falling edge configuration). The following figure shows the relationship between the supply voltage and the LVD signal. Refer to the datasheet for the hysteresis voltage ($V_{LVDhyst}$).

Figure 3-3. Waveform of the LVD threshold



Generally, digital circuits are powered by V_{DD}, while most of analog circuits are powered by V_{DDA}. To improve the ADC and DAC conversion accuracy, the independent power supply V_{DDA} is implemented to achieve better performance of analog circuits. V_{DDA} can be externally connected to V_{DD} through the external filtering circuit that avoids noise on V_{DDA}, and V_{SSA} should be connected to V_{SS} through the specific circuit independently. Otherwise, when the VDD and VDDA are provided by different power supplies, the difference between VDD and VDDA during power-up and running time should not exceed 0.3V.

To ensure a high accuracy on ADC and DAC, the ADC / DAC independent external reference voltage should be connected to V_{REF+}/V_{REF-} pins. According to the different packages, V_{REF+} pin can be connected to V_{DDA} pin, or external reference voltage which refers to ***Table 11-2. ADC input pins definition*** and***Table 12-1. DAC I/O description***, V_{REF-} pin must be connected to V_{SSA} pin. The V_{REF+} pin is only available on no less than 100-pin packages, or else the V_{REF+} pin is not available and internally connected to V_{DDA}. The V_{REF-} pin is only available on no less than 100-pin packages, or else the V_{REF-} pin is not available and internally connected to V_{SSA}.

3.3.3. 1.2V power domain

The 1.2V power domain supplies power for RISC-V logic, AHB / APB peripherals, the APB interfaces for the Backup domain and the V_{DD} / V_{DDA} domain, etc. Once the 1.2V is powered up, the POR will generate a reset sequence on the 1.2V power domain. If need to enter the expected power saving mode, the associated control bits must be configured. Then, once a WFI (Wait for Interrupt) or WFE (Wait for Event) instruction is executed, the device will enter an expected power saving mode which will be discussed in the following section.

3.3.4. Power saving modes

After a system reset or a power reset, the GD32VF103 MCU operates at full function and all power domains are active. Users can achieve lower power consumption through slowing down the system clocks (HCLK, PCLK1, PCLK2) or gating the clocks of the unused peripherals. Besides, three power saving modes are provided to achieve even lower power consumption, they are Sleep mode, Deep-sleep mode, and Standby mode.

Sleep mode

The Sleep mode is corresponding to the SLEEPING mode of the RISC-V. In Sleep mode, only clock of RISC-V is off. To enter the Sleep mode, it is only necessary to clear the CSR_SLEEPVALUE bit in the RISC-V System Control Register, and execute a WFI or WFE instruction. If the Sleep mode is entered by executing a WFI instruction, any interrupt can wake up the system. If it is entered by executing a WFE instruction, any wakeup event can wake up the system. The mode offers the lowest wakeup time as no time is wasted in interrupt entry or exit.

Deep-sleep mode

The Deep-sleep mode is based on the SLEEPDEEP mode of the RISC-V. In Deep-sleep mode, all clocks in the 1.2V domain are off, and all of IRC8M, HXTAL and PLLs are disabled. The contents of SRAM and registers are preserved. The LDO can operate normally or in low power mode depending on the LDOLP bit in the PMU_CTL register. Before entering the Deep-sleep mode, it is necessary to set the CSR_SLEEPVALUE bit in the RISC-V System Control Register, and clear the STBMOD bit in the PMU_CTL register. Then, the device enters the Deep-sleep mode after a WFI or WFE instruction is executed. If the Deep-sleep mode is entered by executing a WFI instruction, any interrupt from EXTI lines can wake up the system. If it is entered by executing a WFE instruction, any wakeup event from EXTI lines can wake up the system. When exiting the Deep-sleep mode, the IRC8M is selected as the system clock. Notice that an additional wakeup delay will be incurred if the LDO operates in low power mode.

Note: In order to enter Deep-sleep mode smoothly, all EXTI line pending status (in the EXTI_PD register) and related peripheral flags must be reset, refer to ***Table 6-2. EXTI source***. If not, the program will skip the entry process of Deep-sleep mode to continue to execute the following procedure.

Standby mode

The Standby mode is based on the SLEEPDEEP mode of the RISC-V, too. In Standby mode, the whole 1.2V domain is power off, the LDO is shut down, and all of IRC8M, HXTAL and PLLs are disabled. Before entering the Standby mode, it is necessary to set the CSR_SLEEPVALUE bit in the RISC-V System Control Register, and set the STBMOD bit in the PMU_CTL register, and clear WUF bit in the PMU_CS register. Then, the device enters the Standby mode after a WFI or WFE instruction is executed, and the STBF status flag in the PMU_CS register indicates that the MCU has been in Standby mode. There are four wakeup sources for the Standby mode, including the external reset from NRST pin, the RTC alarm events, the FWDGT reset, and the rising edge on WKUP pin. The Standby mode achieves the lowest power consumption, but spends longest time to wake up. Besides, the contents of SRAM and registers in 1.2V power domain are lost in Standby mode. When exiting from the Standby mode, a power-on reset occurs and the RISC-V will execute instruction code from the 0x00000000 address.

Table 3-1. Power saving mode summary

Mode	Sleep	Deep-sleep	Standby
Description	Only CPU clock is off	1. All clocks in the 1.2V domain are off. 2. Disable IRC8M, HXTAL and PLL.	1. The 1.2V domain is power off. 2. Disable IRC8M, HXTAL and PLL.
LDO Status	On(normal power mode)	On (normal or low power mode)	Off
Configuration	CSR_SLEEPVALUE =	CSR_SLEEPVALUE = 1	CSR_SLEEPVALUE = 1

Mode	Sleep	Deep-sleep	Standby
	0	STBMOD = 0	STBMOD = 1, WURST=1
Entry	WFI or WFE	WFI or WFE	WFI or WFE
Wakeup	Any interrupt for WFI. Any event (or interrupt) for WFE(WFI).	Any interrupt from EXTI lines for WFI. Any event(or interrupt) from EXTI for WFE(WFI).	1. NRST pin 2. WKUP pin 3. FWDGT reset 4. RTC
Wakeup Latency	None	IRC8M wakeup time, LDO wakeup time added if LDO is in low power mode	Power on sequence

Note: In Standby mode, all I / Os are in high-impedance state except NRST pin, PC13 pin when configured for RTC function, PC14 and PC15 pins when used as LXTAL crystal oscillator pins, and WKUP pin if enabled.

3.4. Register definition

PMU base address: 0x4000 7000

3.4.1. Control register (PMU_CTL)

Address offset: 0x00

Reset value: 0x0000 0000 (reset by wakeup from Standby mode)

This register can be accessed by half-word(16-bit) or word(32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							rw						r	r	r

Bits	Fields	Descriptions
31:9	Reserved	Must be kept at reset value.
8	WUPEN	WKUP Pin Enable 0: Disable WKUP pin function 1: Enable WKUP pin function If WUPEN is set before entering the Standby mode, a rising edge on the WKUP pin wakes up the system from the Standby mode. As the WKUP pin is active high, the WKUP pin is internally configured to input pull down mode. And set this bit will trigger a wakup event when the input changes to high.
7:3	Reserved	Must be kept at reset value.
2	LVDF	Low Voltage Detector Status Flag 0: Low Voltage event has not occurred (V_{DD} is higher than the specified LVD threshold) 1: Low Voltage event occurred (V_{DD} is equal to or lower than the specified LVD threshold) **Note:** The LVD function is stopped in Standby mode.
1	STBF	Standby Flag 0: The device has not entered the Standby mode

		1: The device has been in the Standby mode This bit is cleared only by a POR/PDR or by setting the STBRST bit in the PMU_CTL register.
0	WUF	Wakeup Flag 0: No wakeup event has been received 1: Wakeup event occurred from the WKUP pin or the RTC alarm event This bit is cleared only by a POR/PDR or by setting the WURST bit in the PMU_CTL register.

4. Backup registers (BKP)

4.1. Overview

The Backup registers are located in the Backup domain that remains powered-on by V_{BAT} even if V_{DD} power is shut down, they are forty-two 16-bit (84 bytes) registers for data protection of user application data, and the wake-up action from Standby mode or system reset do not affect these registers.

In addition, the BKP registers can be used to implement the tamper detection and RTC calibration function.

After reset, any writing access to the registers in Backup domain is disabled, that is, the Backup registers and RTC cannot be written to access. In order to enable access to the Backup registers and RTC, the Power and Backup interface clocks should be enabled firstly by setting the PMUEN and BKPIEN bits in the RCU_APB1EN register, and writing access to the registers in Backup domain should be enabled by setting the BKPWEN bit in the PMU_CTL register.

4.2. Characteristics

- 84 bytes Backup registers which can keep data under power saving mode. If tamper event is detected, Backup registers will be reset.
- The active level of Tamper source (PC13) can be configured.
- RTC Clock Calibration register provides RTC alarm and second output selection, and the calibration value configuration.
- Tamper control and status register (BKP_TPCS) can control tamper detection with interrupt or event capability.

4.3. Function overview

4.3.1. RTC clock calibration

In order to improve the RTC clock accuracy, the MCU provides the RTC output for calibration function. The clock with the frequency f_{RTCCLK}/64 can be output on the PC13. It is enabled by setting the COEN bit in the BKP_OCTL register.

The calibration value is set by RCCV[6:0] in the BKP_OCTL register, and the calibration function can slow down the RTC clock by steps of 1000000/2^20 ppm.

4.3.2. Tamper detection

In order to protect the important user data, the MCU provides the tamper detection function, and it can be independently enabled on TAMPER pin by setting corresponding TPEN bit in the BKP_TPCTL register. To prevent the tamper event from losing, the edge detection is logically ANDed with the TPEN bit, used for tamper detection signal. So the tamper detection configuration should be set before enable TAMPER pin. When the tamper event is detected, the corresponding TEF bit in the BKP_TPCS register will be set. Tamper event can generate an interrupt if tamper interrupt is enabled. Any tamper event will reset all Backup data registers.

Note: When TPAL=0/1, if the TAMPER pin is already high/low before it is enabled(by setting TPEN bit), an extra tamper event is detected, while there was no rising/falling edge on the TAMPER pin after TPEN bit was set.

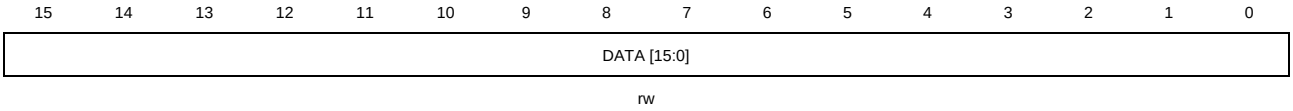
4.4. Register definition

BKP base address: 0x4000 6C00

4.4.1. Backup data register x (BKP_DATAx) (x= 0..41)

Address offset: 0x04 to 0x28, 0x40 to 0xBC
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

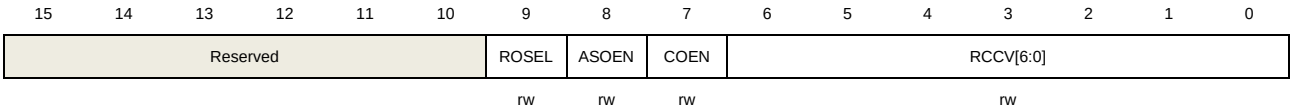


Bits	Fields	Descriptions
15:0	DATA[15:0]	Backup data These bits are used for general purpose data storage. The contents of the BKP_DATAx register will remain even if the wake-up action from Standby mode or system reset or power reset occurs.

4.4.2. RTC signal output control register (BKP_OCTL)

Address offset: 0x2C
Reset value: 0x0000(bit [6:0], bit 8, bit 9 reset by a Backup domain reset, bit 7 reset by a POR/PDR)

This register can be accessed by half-word(16-bit) or word(32-bit)



Bits	Fields	Descriptions
15:10	Reserved	Must be kept at reset value.
9	ROSEL	RTC output selection 0: RTC alarm pulse is selected as the RTC output 1: RTC second pulse is selected as the RTC output
8	ASOEN	RTC alarm or second signal output enable 0: Disable RTC alarm or second output 1: Enable RTC alarm or second output When enable, the TAMPER pin will output the RTC output.
7	COEN	RTC clock calibration output enable 0: Disable RTC clock calibration output

		1: Enable RTC clock calibration output When enable, the TAMPER pin will output a clock with the frequency $f_{RTCCLK}/64$. ASOEN has the priority over COEN. When ASOEN is set, the TAMPER pin will output the RTC alarm or second signal whether COEN is set or not.
6:0	RCCV[6:0]	RTC clock calibration value The value indicates how many clock pulses are ignored or added every 2^20 RTC clock pulses.

4.4.3. Tamper pin control register (BKP_TPCTL)

Address offset: 0x30
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														TPAL	TPEN
														rw	rw

Bits	Fields	Descriptions
15:2	Reserved	Must be kept at reset value.
1	TPAL	TAMPER pin active level 0: The TAMPER pin is active high 1: The TAMPER pin is active low
0	TPEN	TAMPER detection enable 0: The TAMPER pin is free for GPIO functions 1: The TAMPER pin is dedicated for the Backup Reset function. The active level on the TAMPER pin resets all data of the BKP_DATAx registers.

4.4.4. Tamper control and status register (BKP_TPCS)

Address offset: 0x34
Reset value: 0x0000(bit 2 reset by a system reset or the wake-up from Standby mode)

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved						TIF	TEF	Reserved					TPIE	TIR	TER
						r	r						rw	w	w

Bits	Fields	Descriptions
15:10	Reserved	Must be kept at reset value.

9	TIF	Tamper interrupt flag 0: No tamper interrupt occurred 1: A tamper interrupt occurred This bit is reset by writing 1 to the TIR bit or the TPIE bit being 0.
8	TEF	Tamper event flag 0: No tamper event occurred 1: A tamper event occurred This bit is reset by writing 1 to the TER bit.
7:3	Reserved	Must be kept at reset value.
2	TPIE	Tamper interrupt enable 0: Disable the tamper interrupt 1: Enable the tamper interrupt
1	TIR	Tamper interrupt reset 0: No effect 1: Reset the TIF bit This bit is always read as 0.
0	TER	Tamper event reset 0: No effect 1: Reset the TEF bit This bit is always read as 0.

5. Reset and clock unit (RCU)

5.1. Reset control unit (RCTL)

5.1.1. Overview

GD32VF103 Reset Control includes the control of three kinds of reset: power reset, system reset and backup domain reset. The power reset, known as a cold reset, resets the full system except the Backup domain. The system reset resets the processor core and peripheral IP components except for the JTAG controller and the Backup domain. The backup domain reset resets the Backup domain. The resets can be triggered by an external signal, internal events and the reset generators. More information about these resets will be described in the following sections.

5.1.2. Function overview

Power reset

The Power reset is generated by either an external reset as Power On and Power Down reset (POR/PDR reset) or by the internal reset generator when exiting Standby mode. The power reset sets all registers to their reset values except the Backup domain. The Power reset whose active signal is low, it will be de-asserted when the internal LDO voltage regulator is ready to provide 1.2V power. The RESET service routine vector is fixed at address 0x0000 0000 in the memory map.

System reset

A system reset is generated by the following events:

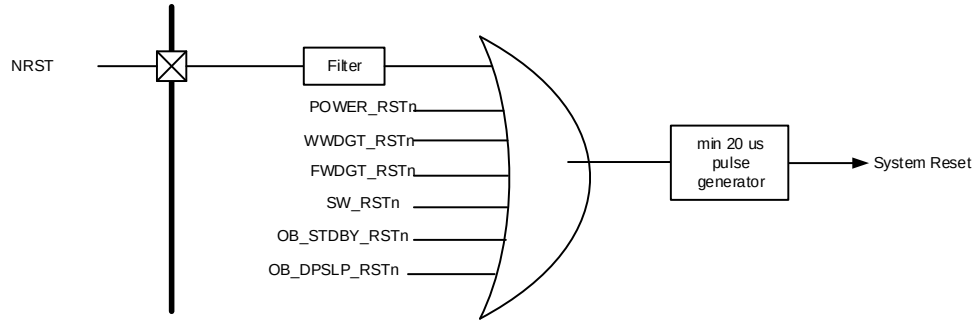
- A power reset (POWER_RSTn).
- An external pin reset (NRST).
- A window watchdog timer reset (WWDGT_RSTn).
- A free watchdog timer reset (FWDGT_RSTn).
- The SYSRESETREQ bit in RISC-V Application Interrupt and Reset Control Register is set (SW_RSTn).
- Reset generated when entering Standby mode when resetting nRST_STDBY bit in User Option Bytes (OB_STDBY_RSTn).
- Reset generated when entering Deep-sleep mode when resetting nRST_DPSLP bit in User Option Bytes (OB_DPSLP_RSTn).

A system reset resets the processor core and peripheral IP components except for the JTAG controller and the Backup domain.

A system reset pulse generator guarantees low level pulse duration of 20 μs for each reset

source (external or internal reset).

Figure 5-1. The system reset circuit



Backup domain reset

A backup domain reset is generated by setting the BKPRST bit in the Backup domain control register or Backup domain power on reset (V_{DD} or V_{BAT} power on, if both supplies have previously been powered off).

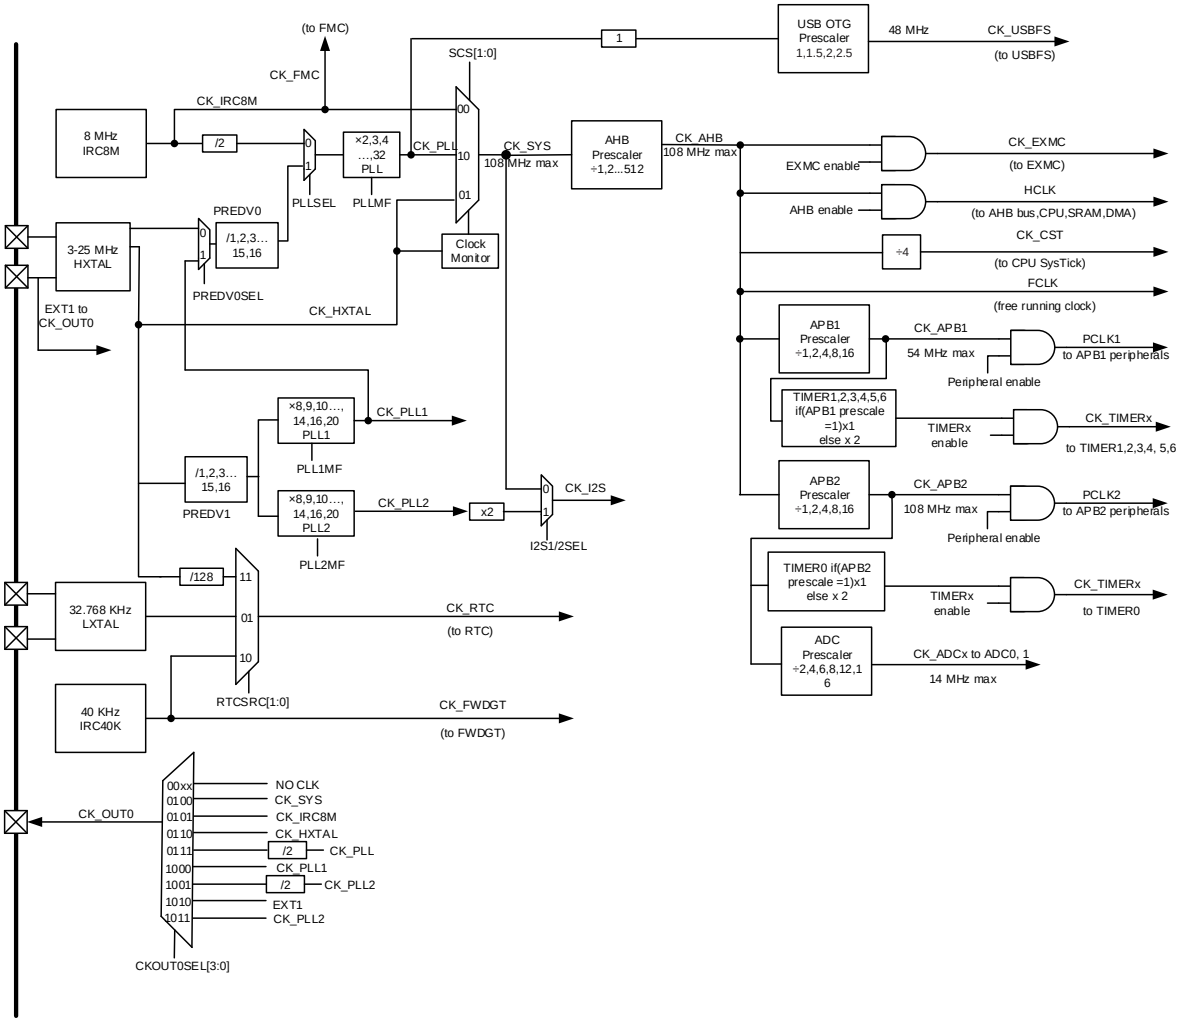
5.2. Clock control unit (CCTL)

5.2.1. Overview

The Clock Control unit provides a range of frequencies and clock functions. These include an Internal 8M RC oscillator (IRC8M), a High Speed crystal oscillator (HXTAL), a Low Speed Internal 40K RC oscillator (IRC40K), a Low Speed crystal oscillator (LXTAL), three Phase Lock Loop (PLL), a HXTAL clock monitor, clock prescalers, clock multiplexers and clock gating circuitry.

The clocks of the AHB, APB and RISC-V are derived from the system clock (CK_SYS) which can source from the IRC8M, HXTAL or PLL. The maximum operating frequency of the system clock (CK_SYS) can be up to 108 MHz. The Free Watchdog Timer has independent clock source (IRC40K), and Real Time Clock (RTC) uses the IRC40K, LXTAL or HXTAL/128 as its clock source.

Figure 5-2. Clock tree



The frequency of AHB, APB2 and the APB1 domains can be configured by each prescaler. The maximum frequency of the AHB, APB2 and APB1 domains is 108 MHz/108 MHz/54 MHz. The RISCV System Timer (SysTick) external clock is clocked with the AHB clock (HCLK) divided by 4.

The ADCs are clocked by the clock of APB2 divided by 2, 4, 6, 8, 12, 16.

The TIMERs are clocked by the clock divided from CK_APB2 and CK_APB1. The frequency of TIMERs clock is equal to CK_APBx(APB prescaler is 1), twice the CK_APBx(APB prescaler is not 1).

The USBFS is clocked by the clock of CK_PLL as the clock source of 48MHz.

The I2S is clocked by the clock of CK_SYS or PLL2*2 which defined by I2SxSEL bit in RCU_CFG1 register.

The RTC is clocked by LXTAL clock or IRC40K clock or HXTAL clock divided by 128 (defined which select by RTCSRC bit in Backup Domain Control Register (RCU_BDCTL). After the

RTC select HXTAL clock divided by 128, the clock disappeared when the 1.2V core domain power off. After the RTC select IRC40K, the clock disappeared when V_{DD} power off. After the RTC select LXTAL, the clock disappeared when V_{DD} and V_{BAT} power off.

The FWDGT is clocked by IRC40K clock, which is forced on when FWDGT started.

The FMC is clocked by IRC8M clock, which is forced on when IRC8M started.

5.2.2. Characteristics

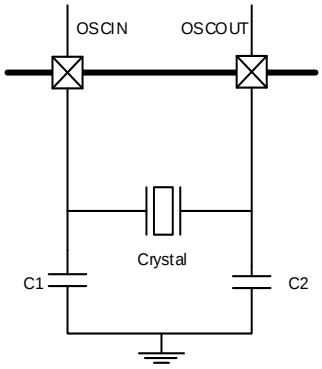
- 3 to 25 MHz High Speed crystal oscillator (HXTAL).
- Internal 8 MHz RC oscillator (IRC8M).
- 32,768 Hz Low Speed crystal oscillator (LXTAL).
- Internal 40KHz RC oscillator (IRC40K).
- PLL clock source can be HXTAL or IRC8M.
- HXTAL clock monitor.

5.2.3. Function overview

High speed crystal oscillator (HXTAL)

The high speed external crystal oscillator (HXTAL), which has a frequency from 3 to 25 MHz, produces a highly accurate clock source for use as the system clock. A crystal with a specific frequency must be connected and located close to the two HXTAL pins. The external resistor and capacitor components connected to the crystal are necessary for proper oscillation.

Figure 5-3. HXTAL clock source



The HXTAL crystal oscillator can be switched on or off using the HXTALEN bit in the Control Register RCU_CTL. The HXTALSTB flag in Control Register RCU_CTL indicates if the high-speed external crystal oscillator is stable. When the HXTAL is powered up, it will not be released for use until this HXTALSTB bit is set by the hardware. This specific delay period is known as the oscillator “Start-up time”. As the HXTAL becomes stable, an interrupt will be generated if the related interrupt enable bit HXTALSTBIE in the Interrupt Register RCU_INT is set. At this point the HXTAL clock can be used directly as the system clock source or the PLL input clock.

Select external clock bypass mode by setting the HXTALBPS and HXTALEN bits in the Control Register RCU_CTL. The CK_HXTAL is equal to the external clock which drives the OSCIN pin.

Internal 8M RC oscillators (IRC8M)

The internal 8M RC oscillator, IRC8M, has a fixed frequency of 8 MHz and is the default clock source selection for the CPU when the device is powered up. The IRC8M oscillator provides a lower cost type clock source as no external components are required. The IRC8M RC oscillator can be switched on or off using the IRC8MEN bit in the Control Register RCU_CTL. The IRC8MSTB flag in the Control Register RCU_CTL is used to indicate if the internal 8M RC oscillator is stable. The start-up time of the IRC8M oscillator is shorter than the HXTAL crystal oscillator. An interrupt can be generated if the related interrupt enable bit, IRC8MSTBIE, in the Clock Interrupt Register, RCU_INT, is set when the IRC8M becomes stable. The IRC8M clock can also be used as the system clock source or the PLL input clock.

The frequency accuracy of the IRC8M can be calibrated by the manufacturer, but its operating frequency is still less accurate than HXTAL. The application requirements, environment and cost will determine which oscillator type is selected.

If the HXTAL or PLL is the system clock source, to minimize the time required for the system to recover from the Deep-sleep Mode, the hardware forces the IRC8M clock to be the system clock when the system initially wakes-up.

Phase locked loop (PLL)

There are three internal Phase Locked Loop, including PLL, PLL1 and PLL2.

The PLL can be switched on or off by using the PLLEN bit in the RCU_CTL Register. The PLLSTB flag in the RCU_CTL Register will indicate if the PLL clock is stable. An interrupt can be generated if the related interrupt enable bit, PLLSTBIE, in the RCU_INT Register, is set as the PLL becomes stable.

The PLL1 can be switched on or off by using the PLL1EN bit in the RCU_CTL Register. The PLL1STB flag in the RCU_CTL Register will indicate if the PLL1 clock is stable. An interrupt can be generated if the related interrupt enable bit, PLL1STBIE, in the RCU_INT Register, is set as the PLL1 becomes stable.

The PLL2 can be switched on or off by using the PLL2EN bit in the RCU_CTL Register. The PLL2STB flag in the RCU_CTL Register will indicate if the PLL2 clock is stable. An interrupt can be generated if the related interrupt enable bit, PLL2STBIE, in the RCU_INT Register, is set as the PLL2 becomes stable.

The three PLLs are closed by hardware when entering the Deepsleep/Standby mode or HXTAL monitor fail when HXTAL used as the source clock of the PLLs.

Low speed crystal oscillator (LXTAL)

The low speed external crystal or ceramic resonator oscillator, which has a frequency of 32,768 Hz, produces a low power but highly accurate clock source for the Real Time Clock circuit. The LXTAL oscillator can be switched on or off using the LXTALEN bit in the Backup Domain Control Register (RCU_BDCTL). The LXTALSTB flag in the Backup Domain Control Register (RCU_BDCTL) will indicate if the LXTAL clock is stable. An interrupt can be generated if the related interrupt enable bit, LXTALSTBIE, in the Interrupt Register RCU_INT is set when the LXTAL becomes stable.

Select external clock bypass mode by setting the LXTALBPS and LXTALEN bits in the Backup Domain Control Register (RCU_BDCTL). The CK_LXTAL is equal to the external clock which drives the OSC32IN pin.

Internal 40K RC oscillator (IRC40K)

The internal RC oscillator has a frequency of about 40 kHz and is a low power clock source for the Real Time Clock circuit or the Free Watchdog Timer. The IRC40K offers a low cost clock source as no external components are required. The IRC40K RC oscillator can be switched on or off by using the IRC40KEN bit in the Reset source/clock Register (RCU_RSTSCK). The IRC40KSTB flag in the Reset source/clock Register RCU_RSTSCK will indicate if the IRC40K clock is stable. An interrupt can be generated if the related interrupt enable bit IRC40KSTBIE in the Clock Interrupt Register (RCU_INT) is set when the IRC40K becomes stable.

The IRC40K can be trimmed by TIMER4_CH3, user can get the clocks frequency, and adjust the RTC and FWDGT counter. Please refer to TIMER4CH3_IREMAP in AFIO_PCF0 register.

System clock (CK_SYS) selection

After the system reset, the default CK_SYS source will be IRC8M and can be switched to HXTAL or CK_PLL by changing the System Clock Switch bits, SCS, in the Clock configuration register 0, RCU_CFG0. When the SCS value is changed, the CK_SYS will continue to operate using the original clock source until the target clock source is stable. When a clock source is directly or indirectly (by PLL) used as the CK_SYS, it is not possible to stop it.

HXTAL clock monitor (CKM)

The HXTAL clock monitor function is enabled by the HXTAL Clock Monitor Enable bit, CKMEN, in the Control Register (RCU_CTL). This function should be enabled after the HXTAL start-up delay and disabled when the HXTAL is stopped. Once the HXTAL failure is detected, the HXTAL will be automatically disabled. The HXTAL Clock Stuck interrupt Flag, CKMIF, in the Clock Interrupt Register, RCU_INT, will be set and the HXTAL failure event will be generated. This failure interrupt is connected to the Non-Maskable Interrupt, NMI, of the RISC-V. If the HXTAL is selected as the clock source of CK_SYS, PLL and CK_RTC, the HXTAL failure will force the CK_SYS source to IRC8M, the PLL will be disabled automatically.

If the HXTAL is selected as the clock source of PLL, the HXTAL failure will force the PLL closed automatically. If the HXTAL is selected as the clock source of RTC, the HXTAL failure will reset the RTC clock selection.

Clock output capability

The clock output capability is ranging from 0.09375 MHz to 108 MHz. There are several clock signals can be selected via the CK_OUT0 Clock Source Selection bits, CKOUT0SEL, in the Clock Configuration Register 0 (RCU_CFG0). The corresponding GPIO pin should be configured in the properly Alternate Function I/O (AFIO) mode to output the selected clock signal..

Table 5-1. Clock output 0 source select

Clock Source 0 Selection bits	Clock Source
00xx	NO CLK
0100	CK_SYS
0101	CK_IRC8M
0110	CK_HXTAL
0111	CK_PLL/2
1000	CK_PLL1
1001	CK_PLL2/2
1010	EXT1
1011	CK_PLL2

Voltage control

The 1.2V domain voltage in Deep-sleep mode can be controlled by DSLPVS[1:0] bit in the Deep-sleep mode voltage register (RCU_DSV).

Table 5-2. 1.2V domain voltage selected in deep-sleep mode

DSLPVS[1:0]	Deep-sleep mode voltage(V)
00	1.2
01	1.1
10	1.0
11	0.9

5.3. Register definition

RCU base address: 0x4002 1000

5.3.1. Control register (RCU_CTL)

Address offset: 0x00

Reset value: 0x0000 xx83 where x is undefined.

This register can be accessed by byte(8-bit), half-word(16-bit) and word(32-bit)

Bits	Fields	Descriptions
31:30	Reserved	Must be kept at reset value.
29	PLLMF[4]	Bit 4 of PLLMF see bits 21:18 of RCU_CFG0
28	ADCPSC[2]	Bit 2 of ADCPSC see bits 15:14 of RCU_CFG0
27:24	CKOUT0SEL[3:0]	CKOUT0 Clock Source Selection Set and reset by software. 00xx: No clock selected 0100: System clock selected 0101: High Speed 8M Internal Oscillator clock selected 0110: External High Speed oscillator clock selected 0111: (CK_PLL / 2) clock selected

		1000: CK_PLL1 clock selected 1001: CK_PLL2 clock divided by 2 selected 1010: EXT1 selected 1011: CK_PLL2 clock selected
23:22	USBFSPSC[1:0]	USBFS clock prescaler selection Set and reset by software to control the USBFS clock prescaler value. The USBFS clock must be 48MHz. These bits can't be reset if the USBFS clock is enabled. 00: CK_USBFS = CK_PLL / 1.5 01: CK_USBFS = CK_PLL 10: CK_USBFS = CK_PLL / 2.5 11: CK_USBFS = CK_PLL / 2
21:18	PLLMF[3:0]	The PLL clock multiplication factor Bit 29 of RCU_CFG0 and these bits are written by software to define the PLL multiplication factor **Caution**: The PLL output frequency must not exceed 108 MHz 00000: (PLL source clock x 2) 00001: (PLL source clock x 3) 00010: (PLL source clock x 4) 00011: (PLL source clock x 5) 00100: (PLL source clock x 6) 00101: (PLL source clock x 7) 00110: (PLL source clock x 8) 00111: (PLL source clock x 9) 01000: (PLL source clock x 10) 01001: (PLL source clock x 11) 01010: (PLL source clock x 12) 01011: (PLL source clock x 13) 01100: (PLL source clock x 14) 01101: (PLL source clock x 6.5) 01110: (PLL source clock x 16) 01111: (PLL source clock x 16) 10000: (PLL source clock x 17) 10001: (PLL source clock x 18) 10010: (PLL source clock x 19) 10011: (PLL source clock x 20) 10100: (PLL source clock x 21) 10101: (PLL source clock x 22) 10110: (PLL source clock x 23) 10111: (PLL source clock x 24) 11000: (PLL source clock x 25) 11001: (PLL source clock x 26) 11010: (PLL source clock x 27)

		11011: (PLL source clock x 28) 11100: (PLL source clock x 29) 11101: (PLL source clock x 30) 11110: (PLL source clock x 31) 11111: (PLL source clock x 32)
17	PREDV0_LSB	The LSB of PREDV0 division factor This bit is the same bit as PREDV0 division factor bit [0] from RCU_CFG1. Changing the PREDV0 division factor bit [0] from RCU_CFG1, this bit is also changed. When the PREDV0 division factor bits [3:1] are not set, this bit controls PREDV0 input clock divided by 2 or not.
16	PLLSEL	PLL Clock Source Selection Set and reset by software to control the PLL clock source. 0: (IRC8M / 2) clock selected as source clock of PLL 1: HXTAL selected as source clock of PLL
15:14	ADCPSC[1:0]	ADC clock prescaler selection These bits and bit 28 of RCU_CFG0 are written by software to define the ADC prescaler factor.Set and cleared by software. 000: (CK_APB2 / 2) selected 001: (CK_APB2 / 4) selected 010: (CK_APB2 / 6) selected 011: (CK_APB2 / 8) selected 100: (CK_APB2 / 2) selected 101: (CK_APB2 / 12) selected 110: (CK_APB2 / 8) selected 111: (CK_APB2 / 16) selected
13:11	APB2PSC[2:0]	APB2 prescaler selection Set and reset by software to control the APB2 clock division ratio. 0xx: CK_AHB selected 100: (CK_AHB / 2) selected 101: (CK_AHB / 4) selected 110: (CK_AHB / 8) selected 111: (CK_AHB / 16) selected
10:8	APB1PSC[2:0]	APB1 prescaler selection Set and reset by software to control the APB1 clock division ratio. Caution: The CK_APB1 output frequency must not exceed 60 MHz. 0xx: CK_AHB selected 100: (CK_AHB / 2) selected 101: (CK_AHB / 4) selected 110: (CK_AHB / 8) selected 111: (CK_AHB / 16) selected

7:4	AHBPSC[3:0]	AHB prescaler selection Set and reset by software to control the AHB clock division ratio 0xxx: CK_SYS selected 1000: (CK_SYS / 2) selected 1001: (CK_SYS / 4) selected 1010: (CK_SYS / 8) selected 1011: (CK_SYS / 16) selected 1100: (CK_SYS / 64) selected 1101: (CK_SYS / 128) selected 1110: (CK_SYS / 256) selected 1111: (CK_SYS / 512) selected
3:2	SCSS[1:0]	System clock switch status Set and reset by hardware to indicate the clock source of system clock. 00: select CK_IRC8M as the CK_SYS source 01: select CK_HXTAL as the CK_SYS source 10: select CK_PLL as the CK_SYS source 11: reserved
1:0	SCS[1:0]	System clock switch Set by software to select the CK_SYS source. Because the change of CK_SYS has inherent latency, software should read SCSS to confirm whether the switching is complete or not. The switch will be forced to IRC8M when leaving Deep-sleep and Standby mode or HXTAL failure is detected by HXTAL clock monitor when HXTAL is selected directly or indirectly as the clock source of CK_SYS 00: select CK_IRC8M as the CK_SYS source 01: select CK_HXTAL as the CK_SYS source 10: select CK_PLL as the CK_SYS source 11: reserved

5.3.3. Clock interrupt register (RCU_INT)

Address offset: 0x08

Reset value: 0x0000 0000

This register can be accessed by byte(8-bit), half-word(16-bit) and word(32-bit)

15	Reserved	Must be kept at reset value
14	PLL2STBIE	PLL2 Stabilization Interrupt Enable

		Set and reset by software to enable/disable the PLL2 stabilization interrupt. 0: Disable the PLL2 stabilization interrupt 1: Enable the PLL2 stabilization interrupt
13	PLL1STBIE	PLL1 Stabilization Interrupt Enable Set and reset by software to enable/disable the PLL1 stabilization interrupt. 0: Disable the PLL1 stabilization interrupt 1: Enable the PLL1 stabilization interrupt
12	PLLSTBIE	PLL Stabilization Interrupt Enable Set and reset by software to enable/disable the PLL stabilization interrupt. 0: Disable the PLL stabilization interrupt 1: Enable the PLL stabilization interrupt
11	HXTALSTBIE	HXTAL Stabilization Interrupt Enable Set and reset by software to enable/disable the HXTAL stabilization interrupt 0: Disable the HXTAL stabilization interrupt 1: Enable the HXTAL stabilization interrupt
10	IRC8MSTBIE	IRC8M Stabilization Interrupt Enable Set and reset by software to enable/disable the IRC8M stabilization interrupt 0: Disable the IRC8M stabilization interrupt 1: Enable the IRC8M stabilization interrupt
9	LXTALSTBIE	LXTAL Stabilization Interrupt Enable LXTAL stabilization interrupt enable/disable control 0: Disable the LXTAL stabilization interrupt 1: Enable the LXTAL stabilization interrupt
8	IRC40KSTBIE	IRC40K Stabilization interrupt enable IRC40K stabilization interrupt enable/disable control 0: Disable the IRC40K stabilization interrupt 1: Enable the IRC40K stabilization interrupt
7	CKMIF	HXTAL Clock Stuck Interrupt Flag Set by hardware when the HXTAL clock is stuck. Reset when setting the CKMIC bit by software. 0: Clock operating normally 1: HXTAL clock stuck
6	PLL2STBIF	PLL2 stabilization interrupt flag Set by hardware when the PLL2 is stable and the PLL2STBIE bit is set. Reset when setting the PLL2STBIC bit by software. 0: No PLL2 stabilization interrupt generated 1: PLL2 stabilization interrupt generated
5	PLL1STBIF	PLL1 stabilization interrupt flag Set by hardware when the PLL1 is stable and the PLL1STBIE bit is set.

Reset when setting the PLL1STBIC bit by software.
0: No PLL1 stabilization interrupt generated
1: PLL1 stabilization interrupt generated

4	PLLSTBIF	PLL stabilization interrupt flag Set by hardware when the PLL is stable and the PLLSTBIE bit is set. Reset when setting the PLLSTBIC bit by software. 0: No PLL stabilization interrupt generated 1: PLL stabilization interrupt generated
3	HXTALSTBIF	HXTAL stabilization interrupt flag Set by hardware when the High speed 3 ~ 25MHz crystal oscillator clock is stable and the HXTALSTBIE bit is set. Reset when setting the HXTALSTBIC bit by software. 0: No HXTAL stabilization interrupt generated 1: HXTAL stabilization interrupt generated
2	IRC8MSTBIF	IRC8M stabilization interrupt flag Set by hardware when the Internal 8 MHz RC oscillator clock is stable and the IRC8MSTBIE bit is set. Reset when setting the IRC8MSTBIC bit by software. 0: No IRC8M stabilization interrupt generated 1: IRC8M stabilization interrupt generated
1	LXTALSTBIF	LXTAL stabilization interrupt flag Set by hardware when the Low speed 32,768 Hz crystal oscillator clock is stable and the LXTALSTBIE bit is set. Reset when setting the LXTALSTBIC bit by software. 0: No LXTAL stabilization interrupt generated 1: LXTAL stabilization interrupt generated
0	IRC40KSTBIF	IRC40K stabilization interrupt flag Set by hardware when the Internal 40kHz RC oscillator clock is stable and the IRC40KSTBIE bit is set. Reset when setting the IRC40KSTBIC bit by software. 0: No IRC40K stabilization clock ready interrupt generated 1: IRC40K stabilization interrupt generated

5.3.4. APB2 reset register (RCU_APB2RST)

Address offset: 0x0C
Reset value: 0x0000 0000

This register can be accessed by byte(8-bit), half-word(16-bit) and word(32-bit)

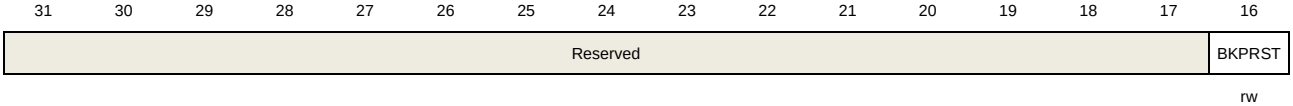
5.3.9. Backup domain control register (RCU_BDCTL)

Address offset: 0x20

Reset value: 0x0000 0018, reset by Backup domain Reset.

This register can be accessed by byte(8-bit), half-word(16-bit) and word(32-bit)

Note: The LXTALEN, LXTALBPS, RTCSRC and RTCEN bits of the Backup domain control register (RCU_BDCTL) are only reset after a Backup domain Reset. These bits can be modified only when the BKPWEN bit in the Power control register (PMU_CTL) is set.



rw

6. Interrupt / event controller (EXTI)

6.1. Overview

RISC-V integrates the Enhancement Core-Local Interrupt Controller (ECLIC) for efficient interrupts processing. ECLIC is designed to provide low-latency, vectored, pre-emptive interrupts for RISC-V systems. When activated the ECLIC subsumes and replaces the existing RISC-V local interrupt scheme (CLINT). The CLIC design has a base design that requires minimal hardware, but supports additional extensions to provide hardware acceleration. The goal of the ECLIC design is to provide support for a variety of software ABI and interrupt models, without complex hardware that can impact high-performance processor implementations. It's tightly coupled to the processor core. You can read the Technical Reference Manual of RISC-V for more details about ECLIC.

EXTI (interrupt/event controller) contains up to 19 independent edge detectors and generates interrupt requests or events to the processor. The EXTI has three trigger types: rising edge, falling edge and both edges. Each edge detector in the EXTI can be configured and masked independently.

6.2. Characteristics

- Up to 68 maskable peripheral interrupts.
- 4 bits interrupt priority configuration—16 priority levels.
- Support interrupt pre-emption and tail-chaining.
- Wake up system from power saving mode.
- Up to 19 independent edge detectors in EXTI.
- Three trigger types: rising, falling and both edges.
- Software interrupt or event trigger.
- Trigger sources configurable.

6.3. Function overview

The RISC-V processor and the Enhancement Core-Local Interrupt Controller (ECLIC) prioritize and handle all interrupts in machine mode.

The processor supports tail-chaining, which enables back-to-back interrupts to be performed without the overhead of state saving and restoration. The following tables list all interrupt types.

Table 6-1. Interrupt vector table

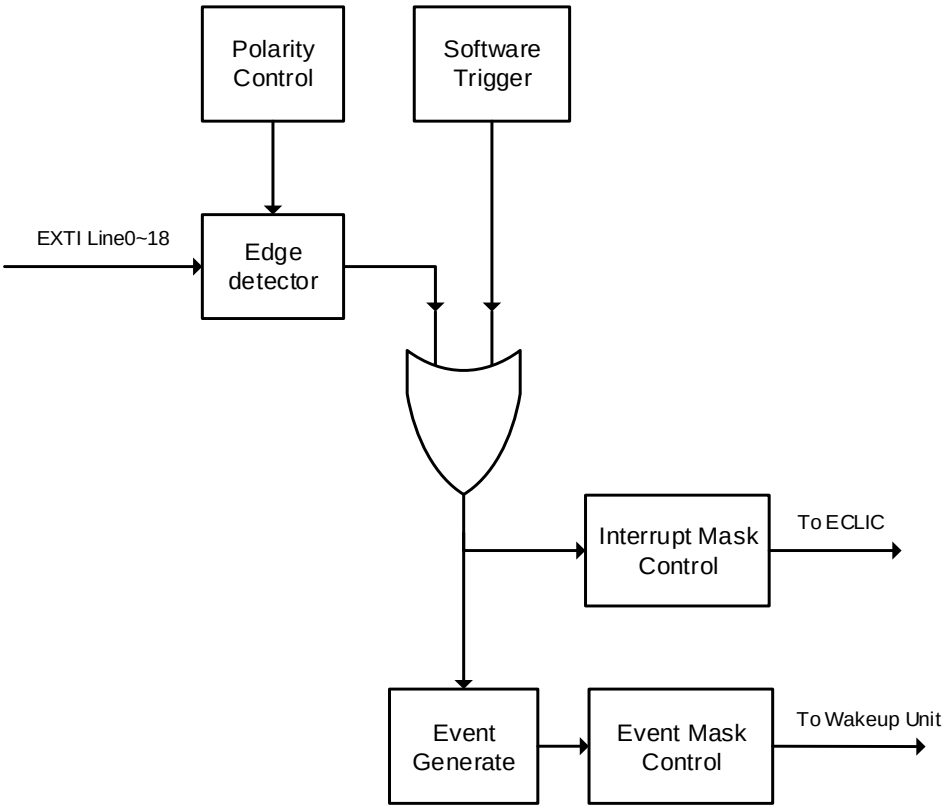
6.4. External interrupt and event block diagram

Figure 6-1. Block diagram of EXTI



6.5. External interrupt and event function overview

The EXTI contains up to 19 independent edge detectors and generates interrupts request or event to the processor. The EXTI has three trigger types: rising edge, falling edge and both edges. Each edge detector in the EXTI can be configured and masked independently.

The EXTI trigger source includes 16 external lines from GPIO pins and 3 lines from internal modules which refers to ***Table 6-2. EXTI source***. All GPIO pins can be selected as an EXTI trigger source by configuring AFIO_EXTISSx registers in AFIO module (please refer to ***General-purpose and alternate-function I/Os (GPIO and AFIO)*** section for detail).

EXTI can provide not only interrupts but also event signals to the processor. The RISC-V processor fully implements the Wait For Interrupt (WFI) instruction. EXTI can be used to wake up processor and the whole system when some expected event occurs, such as a special GPIO pin toggling or RTC alarm.

Hardware trigger

Hardware trigger may be used to detect the voltage change of external or internal signals. The software should follow these steps to use this function:

1. Configure EXTI sources in AFIO module based on application requirement.
2. Configure EXTI_RTEN and EXTI_FTEN to enable the rising or falling detection on related pins. (Software may set both RTENx and FTENx for a pin at the same time to detect both rising and falling changes on this pin).
3. Enable interrupts or events by setting related EXTI_INTEN or EXTI_EVEN bits.
4. EXTI starts to detect changes on the configured pins. The related interrupt or event will be triggered when desired change is detected on these pins. If the interrupt is triggered, the related PDx is set; if the event is triggered, the related PDx is not set. The software should response to the interrupts or events and clear these PDx bits.

Software trigger

Software may also trigger EXTI interrupts or events following these steps:

1. Enable interrupts or events by setting related EXTI_INTEN or EXTI_EVEN bits.
2. Set SWIEVx bits in EXTI_SWIEV register, the related interrupt or event will be triggered immediately. If the interrupt is triggered, the related PDx is set; if the event is triggered, the related PDx is not set. Software should response to these interrupts, and clear related PDx bits.

Bits	Fields	Descriptions
31: 19	Reserved	Must be kept at reset value.
18: 0	PDx	Interrupt pending status x (x = 0…18) 0: EXTI linex is not triggered 1: EXTI linex is triggered This bit is cleared to 0 by writing 1 to it.

7. General-purpose and alternate-function I/Os (GPIO and AFIO)

7.1. Overview

There are up to 80 general purpose I/O pins (GPIO), named PA0 ~ PA15, PB0 ~ PB15, PC0 ~ PC15, PD0 ~ PD15 and PE0 ~ PE15 for the device to implement logic input/output functions. Each GPIO port has related control and configuration registers to satisfy the requirements of specific applications. The external interrupt on the GPIO pins of the device have related control and configuration registers in the Interrupt/event Controller Unit (EXTI).

The GPIO ports are pin-shared with other alternative functions (AFs) to obtain maximum flexibility on the package pins. The GPIO pins can be used as alternative functional pins by configuring the corresponding registers regardless of the AF input or output pins.

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), input, peripheral alternate function or analog mode. Each GPIO pin can be configured as pull-up, pull-down or no pull-up/pull-down. All GPIOs are high-current capable except for analog mode.

7.2. Characteristics

- Input/output direction control.
- Schmitt trigger input function enable control.
- Each pin weak pull-up/pull-down function.
- Output push-pull/open drain enable control.
- Output set/reset control.
- External interrupt with programmable trigger edge – using EXTI configuration registers.
- Analog input/output configuration.
- Alternate function input/output configuration.
- Port configuration lock.

7.3. Function overview

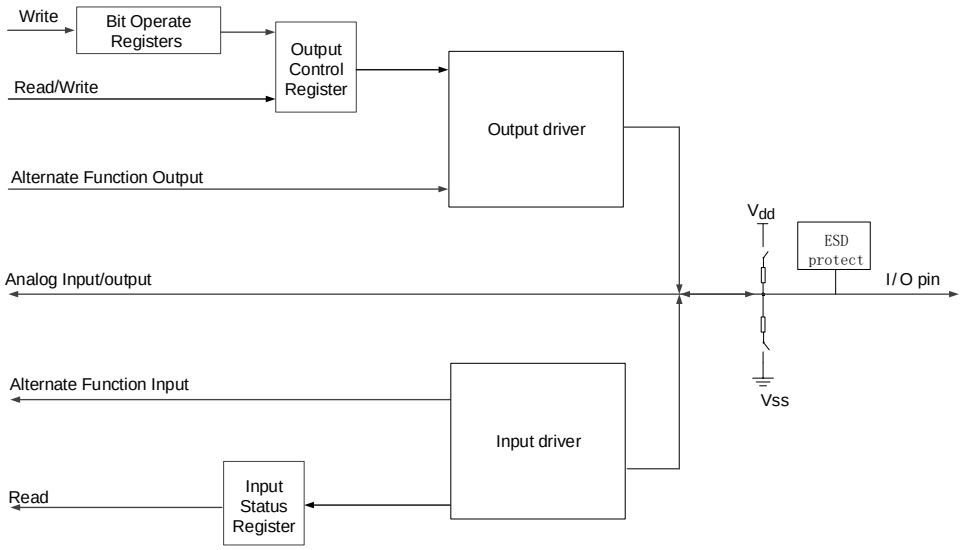
Each of the general-purpose I/O ports can be configured as 8 modes: analog inputs, input floating, input pull-down/pull-up, GPIO push-pull/open-drain or AFIO push-pull/open-drain mode by two GPIO configuration registers (GPIOx_CTL0/GPIOx_CTL1), and two 32-bits data registers (GPIOx_ISTAT and GPIOx_OCTL). ***Table 7-1. GPIO configuration table*** shows the details.

Table 7-1. GPIO configuration table

Configuration mode		CTL[1:0]	MD[1:0]	OCTL
Input	Analog	00	0	don't care
	Input floating	01		don't care
	Input pull-down	10		0
	Input pull-up	10		1
General purpose Output (GPIO)	Push-pull	00	00: Reserved 01: Speed up to 10MHz 10: Speed up to 2MHz 11: Speed up to 50MHz	0 or 1
	Open-drain	01		0 or 1
Alternate Function Output (AFIO)	Push-pull	10		don't care
	Open-drain	11		don't care

Figure 7-1. Basic structure of a general-pupose I/O shows the basic structure of an I/O port bit.

Figure 7-1. Basic structure of a general-pupose I/O



7.3.1. GPIO pin configuration

During or just after the reset period, the alternative functions are all inactive and the GPIO ports are configured into the input floating mode that input disabled without Pull-Up (PU)/Pull-Down (PD) resistors. But the JTAG/Serial-Wired Debug pins are in input PU/PD mode after reset:

PA15: JTDI in PU mode.
PA14: JTCK in PD mode.
PA13: JTMS in PU mode.
PB4: NJTRST in PU mode.
PB3: JTDO in Floating mode.

The GPIO pins can be configured as inputs or outputs. When the GPIO pins are configured

as input pins, all GPIO pins have an internal weak pull-up and weak pull-down which can be chosen. And the data on the external pins can be captured at every APB2 clock cycle to the port input status register (GPIOx_ISTAT).

When the GPIO pins are configured as output pins, user can configure the speed of the ports. And chooses the output driver mode: Push-Pull or Open-Drain mode. The value of the port output control register (GPIOx_OCTL) is output on the I/O pin.

There is no need to read-then-write when programming the GPIOx_OCTL at bit level, user can modify only one or several bits in a single atomic APB2 write access by programming '1' to the bit operate register (GPIOx_BOP, or for clearing only GPIOx_BC). The other bits will not be affected.

7.3.2. External interrupt/event lines

All ports have external interrupt capability. To use external interrupt lines, the port must be configured in input mode.

7.3.3. Alternate functions (AF)

When the port is configured as AFIO (set CTLy bits to "0b10" or "0b11", and set MDy bits to "0b01", "0b10", or "0b11", which is in GPIOx_CTL0/GPIOx_CTL1 registers), the port is used as peripheral alternate functions. The detail alternate function assignments for each port are in the device datasheet.

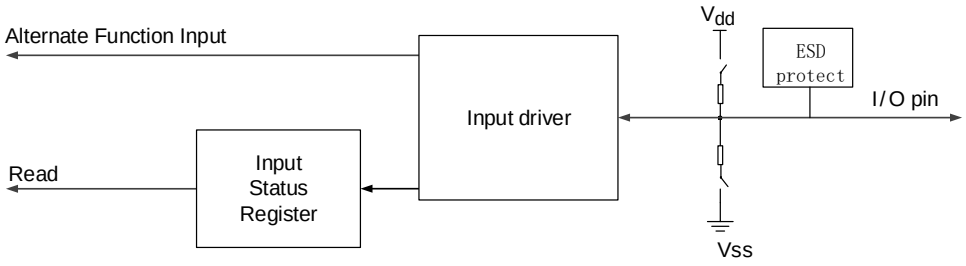
7.3.4. Input configuration

When GPIO pin is configured as Input:

- The schmitt trigger input is enabled.
- The weak pull-up and pull-down resistors could be chosen.
- Every APB2 clock cycle the data present on the I/O pin is got to the port input status Register.
- The output buffer is disabled.

Figure 7-2. Basic structure of Input configuration shows the input configuration.

Figure 7-2. Basic structure of Input configuration



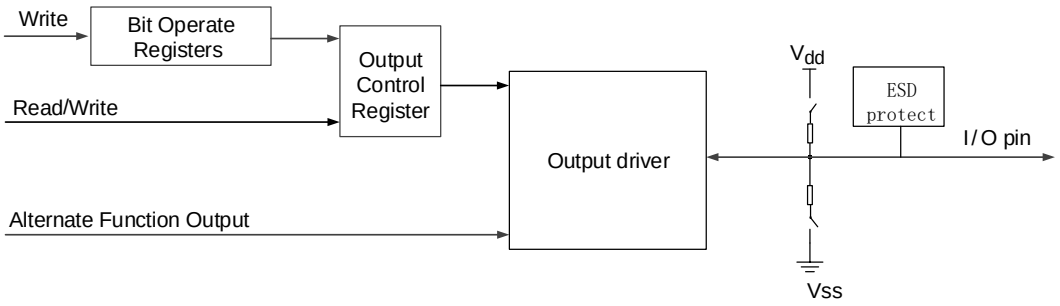
7.3.5. Output configuration

When GPIO pin is configured as output:

- The schmitt trigger input is enabled.
- The weak pull-up and pull-down resistors are disabled.
- The output buffer is enabled.
- Open Drain Mode: The pad output low level when a “0” in the output control register, while the pad leaves Hi-Z when a “1” in the output control register.
- Push-Pull Mode: The pad output low level when a “0” in the output control register, while the pad output high level when a “1” in the output control register.
- A read access to the port output control register gets the last written value.
- A read access to the port input status register gets the I/O state.

Figure 7-3. Basic structure of Output configuration shows the output configuration.

Figure 7-3. Basic structure of Output configuration



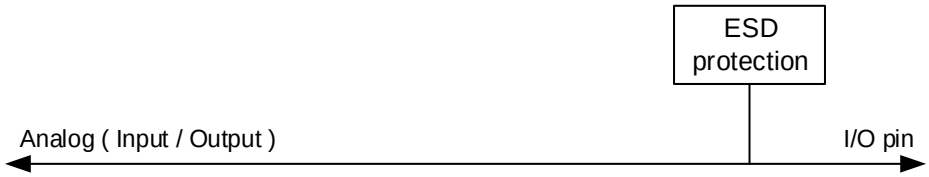
7.3.6. Analog configuration

When GPIO pin is used as analog configuration:

- The weak pull-up and pull-down resistors are disabled.
- The output buffer is disabled.
- The schmitt trigger input is disabled.
- The port input status register of this I/O port bit is “0”.

Figure 7-4. Basic structure of Analog configuration shows the analog configuration.

Figure 7-4. Basic structure of Analog configuration



7.3.7. Alternate function (AF) configuration

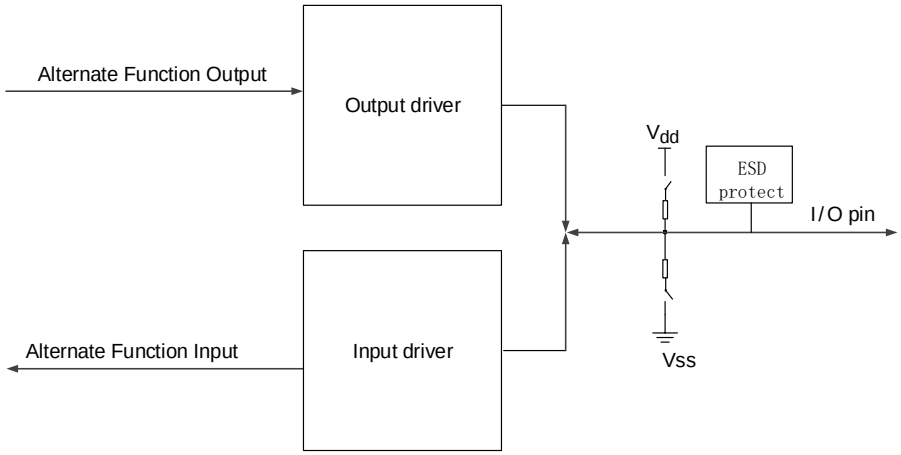
To suit for different device packages, the GPIO supports some alternate functions mapped to some other pins by software.

When be configured as alternate function:

- The output buffer is enabled in Open-Drain or Push-Pull configuration.
- The output buffer is driven by the peripheral.
- The schmitt trigger input is enabled.
- The weak pull-up and pull-down resistors could be chosen when input.
- The I/O pin data is stored into the port input status register every APB2 clock.
- A read access to the port input status register gets the I/O state.
- A read access to the port output control register gets the last written value.

Figure 7-5. Basic structure of Alternate function configuration shows the alternate function configuration.

Figure 7-5. Basic structure of Alternate function configuration



7.3.8. IO pin function selection

Each IO pin can implement many functions, each function selected by GPIO registers.

GPIO:

Each IO pin can be used for GPIO input function by configuring MDy bits to 0b00 in GPIOx_CTL0/GPIOx_CTL1 registers. And set output function by configuring MDy bits to 0b01, 0b10, or 0b11 and configuring CTLy bits of corresponding port in GPIOx_CTL0/GPIOx_CTL1 register to 0b00 (for GPIO push-pull output) or 0b01 (for GPIO open-drain output).

Alternate function:

Each IO pin can be used for AF input function by configuring MDy bits to 0b00 in

GPIOx_CTL0/GPIOx_CTL1 registers. And set output function by configuring MDy bits to 0b01, 0b10, or 0b11 and configuring CTLy bits of corresponding port in GPIOx_CTL0/GPIOx_CTL1 register to 0b10 (for AF push-pull output) or 0b11 (for AF open-drain output).

7.3.9. GPIO locking function

The locking mechanism allows the IO configuration to be protected.

The protected registers are GPIOx_CTL0, GPIOx_CTL1. It allows the I/O configuration to be frozen by the 32-bit locking register (GPIOx_LOCK). When the special LOCK sequence has been occurred on LKK bit in GPIOx_LOCK register and the LKy bit is set in GPIOx_LOCK register, the corresponding port is locked and the corresponding port configuration cannot be modified until the next reset. It should be recommended to be used in the configuration of driving a power module.

7.4. Remapping function I/O and debug configuration

7.4.1. Introduction

In order to expand the flexibility of the GPIO or the usage of peripheral functions, each I/O pin can be configured to have up to four different functions by setting the AFIO Port Configuration Register (AFIO_PCF0/AFIO_PCF1). Suitable pinout locations can be selected using the peripheral IO remapping function. Additionally, various GPIO pins can be selected to be the EXTI interrupt line by setting the relevant EXTI Source Selection Register (AFIO_EXTISSx) to trigger an interrupt or event.

7.4.2. Main features

- APB slave interface for register access.
- EXTI source selection.
- Each pin has up to four alternative functions for configuration.

7.4.3. JTAG alternate function remapping

The debug interface signals are mapped on the GPIO ports as shown in table below.

Table 7-2. Debug interface signals

Pin Name	Function description
PA13	JTMS
PA14	JTCK
PA15	JTDI
PB3	JTDO
PB4	NJTRST

To reduce the number of GPIOs used to debug, user can configure SWJ_CFG [2:0] bits in the AFIO_PCF0 to different value. Refer to table below.

Table 7-3. Debug port mapping and Pin availability

SWJ_CFG[2:0]	JTAG-DP and SW-DP	Pin availability				
		PA13	PA14	PA15	PB3	PB4
000	JTAG-DP Reset state	X	X	X	X	X
001	JTAG-DP but without NJTRST	X	X	X	X	√ (1)
100	JTAG-DP Disabled	√	√	√	√	√
Other	Forbidden					

1. Can't released if using asynchronous trace.
2. " √ " Indicates that the corresponding pin can be used as a general-purpose I/O.
3. "X" Indicates that the corresponding pin can't be used as a general-purpose I/O.
4. The SWJ(Serial Wire JTAG) supports JTAG or SWD access to the Cortex debug port. The default state after reset is SWJ ON without trace.This allows JTAG or SW mode to be enabled by sending a specific sequence on the JTMS/JTCK pin.

7.4.4. TIMER AF remapping

Table 7-4. TIMER alternate function remapping

Alternate function	TIMERX_REMAP [1:0](X = 0，1，2，3)			
	"0" /"00" (no remap)	"1" /"01" (partial remap)	"10" (partial remap)	"11" (full remap)

TIMER4_CH3	TIMER4_CH3 is connected to PA3	IRC40K internal clock is connected to TIMER4_CH3 input for calibration purpose

1. For different packages and flash sizes please refer to the datasheet.

7.4.5. USART AF remapping

Refer to AFIO port configuration register 0 (AFIO_PCF0).

Table 7-6. USART0/1/2 alternate function remapping

Register	USART0	USART1	USART2
USART0_REMAP = 0	PA9(USART0_TX) PA10(USART0_RX)		-
USART0_REMAP = 1	PB6(USART0_TX) PB7(USART0_RX)		-
USART1_REMAP = 0	-	PA0(USART1_CTS) PA1(USART1_RTS) PA2(USART1_TX) PA3(USART1_RX) PA4(USART1_CK)	-
USART1_REMAP = 1 (1)	-	PD3(USART1_CTS) PD4(USART1_RTS) PD5(USART1_TX) PD6(USART1_RX) PD7(USART1_CK)	-
USART2_REMAP [1:0] = “00” (no remap)	-	-	PB10(USART2_TX) PB11(USART2_RX)

			PB12(USART2_CK) PB13(USART2_CTS) PB14(USART2_RTS)
USART2_REMAP [1:0] ="01" (partial remap) (2)	-	-	PC10(USART2_TX) PC11(USART2_RX) PC12(USART2_CK) PB13(USART2_CTS) PB14(USART2_RTS)
USART2_REMAP [1:0] ="11" (full remap) (3)	-	-	PD8(USART2_TX) PD9(USART2_RX) PD10(USART2_CK) PD11(USART2_CTS) PD12(USART2_RTS)

1. For different packages and flash sizes please refer to the datasheet.

7.4.6. I2C0 AF remapping

Refer to AFIO port configuration register 0 (AFIO_PCF0).

Table 7-7. I2C0 alternate function remapping

Register	I2C0_SCL	I2C0_SDA
I2C0_REMAP = 0	PB6	PB7
I2C0_REMAP = 1	PB8	PB9

1. For different packages and flash sizes please refer to the datasheet.

7.4.7. SPI0/SPI2/I2S AF remapping

Refer to AFIO port configuration register 0 (AFIO_PCF0).

Table 7-8. SPI0/SPI2/I2S alternate function remapping

Register	SPI0	SPI2/I2S
SPI0_REMAP = 1	PA4(SPI0_NSS) PA5(SPI0_SCK) PA6(SPI0_MISO) PA7(SPI0_MOSI)	-
SPI0_REMAP = 1	PA15(SPI0_NSS) PB3(SPI0_SCK) PB4(SPI0_MISO) PB5(SPI0_MOSI)	=
SPI2_REMAP = 0	-	PA15(SPI2_NSS/ I2S2_WS) PB3(SPI2_SCK/ I2S2_CK) PB4(SPI2_MISO) PB5(SPI2_MOSI/I2S2_SD)

Register	SPI0	SPI2/I2S
SPI2_REMAP = 1	-	PA4(SPI2_NSS/ I2S2_WS) PC10(SPI2_SCK/ I2S2_CK) PC11(SPI2_MISO) PC12(SPI2_MOSI/I2S2_SD)

7.4.8. CAN0/1 AF remapping

Refer to AFIO port configuration register 0 (AFIO_ PCF0).

Register [1]	CAN0	CAN1
CAN0_IRMP[1:0] =“00”	PA11(CAN0_RX) PA12(CAN0_TX)	-
CAN0_RMPI[1:0] =“10”	PB8(CAN0_RX) PB9(CAN0_TX)	-
CAN0_IRMP[1:0] =“11”[2]	PD0(CAN0_RX) PD1(CAN0_TX)	-
CAN1_RMP = “0”	-	PB12(CAN1_RX) PB13(CAN1_TX)
CAN1_RMP = “1”	-	PB5(CAN1_RX) PB6(CAN1_TX)

1. For different packages and flash sizes please refer to the datasheet.

7.4.9. CLK pins AF remapping

The LXTAL oscillator pins OSC32_IN and OSC32_OUT can be used as general-purpose I/O PC14 and PC15 individually, when the LXTAL oscillator is off. The LXTAL has priority over the GPIOs function.

Note:

- But when the 1.8 V domain is powered off (by entering standby mode) or when the backup domain is supplied by V_{BAT} (V_{DD} no more supplied), the PC14/PC15 GPIO functionality is lost and will be set in analog mode.
- Refer to the note on IO usage restrictions in Section ***Battery backup domain***.

Table 7-9. OSC32 pins configuration

Alternate function	LXTAL= ON	LXTAL= OFF
PC14	OSC32_IN	PC14
PC15	OSC32_OUT	PC15

The HXTAL oscillator pins OSC_IN/OSC_OUT can be used as general-purpose I/O PD0/PD1.

Table 7-10. OSC pins configuration

Alternate function	HXTAL= ON	HXTAL = OFF
PD0	OSC_IN	PD0

PD1	OSC_OUT	PD1

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	OCTLy	Port output control(y=0..15) These bits are set and cleared by software 0: Pin output low 1: Pin output high

7.5.5. Port bit operate register (GPIOx_BOP, x=A..E)

Address offset: 0x10

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CR15	CR14	CR13	CR12	CR11	CR10	CR9	CR8	CR7	CR6	CR5	CR4	CR3	CR2	CR1	CR0

w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits	Fields	Descriptions
31:16	CRy	Port Clear bit y(y=0..15) These bits are set and cleared by software 0: No action on the corresponding OCTLy bit 1: Clear the corresponding OCTLy bit to 0
15:0	BOPy	Port Set bit y(y=0..15) These bits are set and cleared by software 0: No action on the corresponding OCTLy bit 1: Set the corresponding OCTLy bit to 1

7.5.6. Port bit clear register (GPIOx_BC, x=A..E)

Address offset: 0x14
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CR15	CR14	CR13	CR12	CR11	CR10	CR9	CR8	CR7	CR6	CR5	CR4	CR3	CR2	CR1	CR0
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	CRy	Port Clear bit y(y=0..15) These bits are set and cleared by software 0: No action on the corresponding OCTLy bit 1: Clear the corresponding OCTLy bit to 0

7.5.7. Port configuration lock register (GPIOx_LOCK, x=A..E)

Address offset: 0x18
Reset value: 0x0000 0000

This register has to be accessed by word(32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															LKK
															rw

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits	Fields	Descriptions
31:17	Reserved	Must be kept at reset value.
16	LKK	Lock sequence key It can only be setted using the Lock Key Writing Sequence. And can always be read. 0: GPIO_LOCK register is not locked and the port configuration is not locked. 1: GPIO_LOCK register is locked until an MCU reset.. LOCK key configuration sequence Write 1→Write 0→Write 1→ Read 0→ Read 1 Note: The value of LK[15:0] must hold during the LOCK Key Writing sequence.
15:0	LKy	Port Lock bit y(y=0..15) These bits are set and cleared by software 0: The corresponding bit port configuration is not locked 1: The corresponding bit port configuration is locked when LKK bit is “1”

7.5.8. Event control register (AFIO_EC)

Address offset: 0x00

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw		rw	rw		rw		rw		rw		rw	rw	rw	rw

Bits	Fields	Descriptions
31:28	Reserved	Must be kept at reset value.
29	TIMER1ITI1_REMAP	TIMER1 internal trigger 1 remapping These bits are set and cleared by software. It control the TIMER1_ITI1 internal mapping 0: Connect to 0 1: Connect USB OTG SOF (Start of Frame) output TIMER1_ITI1 for calibration purposes
28	SPI2_REMAP	SPI2/I2S2 remapping This bit is set and cleared by software. 0: No remap (SPI2_NSS-I2S2_WS/PA15, SPI2_SCK-I2S2_CK/PB3, SPI2_MISO/PB4, SPI2_MOSI-I2S_SD/PB5) 1: Full remap (SPI2_NSS-I2S2_WS/PA4, SPI2_SCK-I2S2_CK/PC10, SPI2_MISO

		/PC11, SPI2_MOSI-I2S_SD/PC12) Note: This bit is available only in Extra-density devices and High-density devices.
27	Reserved	Must be kept at reset value.
26:24	SWJ_CFG[2:0]	Serial wire JTAG configuration These bits are write-only (when read,the value is undefined).They are used to configure the SWJ alternate function I/Os. The SWJ(Serial Wire JTAG) supports JTAG access to the RISC-V debug port. The default state after reset is SWJ ON.This allows JTAG mode to be enabled by sending a specific sequence on the JTMS/JTCK pin. 000: JTAG-DP Reset State 001: JTAG-DP but without NJTRST 010: JTAG-DP Disabled Other: Undefined
23	Reserved	Must be kept at reset value.
22	CAN1_REMAP	CAN1 interface remapping This bit is set and cleared by software 0: No remap (CAN1_RX/PB12,CAN1_TX/PB13) 1: Remap (CAN1_RX/PB5,CAN1_TX/PB6)
21:17	Reserved	Must be kept at reset value
16	TIMER4CH3_IREMAP	TIMER4 channel3 internal remapping Set and cleared by software.This bit controls the TIMER4_CH3 internal mapping.When reset the timer TIMER4_CH3 is connected to PA3.When set the IRC40K internal clock is connected to TIMER4_CH3 input for calibration purpose. Note: This bit is available only in High-density value line devices.
15	PD01_REMAP	Port D0/Port D1 mapping on OSC_IN/OSC_OUT This bit is set and cleared by software 0: Not remap 1: PD0 remapped on OSC_IN, PD1 remapped on OSC_OUT
14:13	CAN0_REMAP [1:0]	CAN0 interface remapping These bits are set and cleared by software. 00: No remap (CAN0_RX/PA11,CAN0_TX/PA12) 01: Not used 10: Partial remap (CAN0_RX/PB8,CAN0_TX/PB9) 11: Full remap (CAN0_RX/PD0,CAN0_TX/PD1)
12	TIMER3_REMAP	TIMER3 remapping This bit is set and cleared by software 0: No remap (TIMER3_CH0/PB6,TIMER3_CH1/PB7,TIMER3_CH2/PB8, TIMER3_CH3/PB9) 1: Full remap (TIMER3_CH0/PD12,TIMER3_CH1/PD13,TIMER3_CH2/PD14,

		TIMER3_CH3/PD15)
11:10	TIMER2_REMAP[1:0]	TIMER2 remapping These bits are set and cleared by software 00: No remap (TIMER2_CH0/PA6,TIMER2_CH1/PA7,TIMER2_CH2/PB0, TIMER2_CH3/PB1) 01: Not used 10: Partial remap (TIMER2_CH0/PB4,TIMER2_CH1/PB5,TIMER2_CH2/PB0, TIMER2_CH3/PB1) 11: Full remap (TIMER2_CH0/PC6,TIMER2_CH1/PC7,TIMER2_CH2/PC8, TIMER2_CH3/PC9)
9:8	TIMER1_REMAP[1:0]	TIMER1 remapping These bits are set and cleared by software 00: No remap (TIMER1_CH0-TIMER1_ETI/PA0,TIMER1_CH1/PA1, TIMER1_CH2/PA2,TIMER1_CH3/PA3) 01: Partial remap (TIMER1_CH0-TIMER1_ETI/PA15,TIMER1_CH1/PB3, TIMER1_CH2/PA2,TIMER1_CH3/PA3) 10: Partial remap (TIMER1_CH0-TIMER1_ETI/PA0,TIMER1_CH1/PA1, TIMER1_CH2/PB10,TIMER1_CH3/PB11) 11: Full remap(TIMER1_CH0-TIMER1_ETI/PA15,TIMER1_CH1/PB3, TIMER1_CH2/PB10,TIMER1_CH3/PB11)
7:6	TIMER0_REMAP[1:0]	TIMER0 remapping These bits are set and cleared by software 00: No remap (TIMER0_ETI/PA12, TIMER0_CH0/ PA8, TIMER0_CH1/PA9, TIMER0_CH2/PA10,TIMER0_CH3/PA11,TIMER0_BRKIN/PB12, TIMER0_CH0_ON/PB13, TIMER0_CH1_ON/PB14, TIMER0_CH2_ON/PB15) 01: Partial remap (TIMER0_ETI/PA12, TIMER0_CH0/ PA8, TIMER0_CH1/PA9, TIMER0_CH2/PA10,TIMER0_CH3/PA11, TIMER0_BRKIN/PA6, TIMER0_CH0_ON/PA7, TIMER0_CH1_ON/PB0, TIMER0_CH2_ON/PB1) 10: Not used 11: Full remap (TIMER0_ETI/PE7, TIMER0_CH0/ PE9, TIMER0_CH1/PE11, TIMER0_CH2/PE13,TIMER0_CH3/PE14, TIMER0_BRKIN/PE15, TIMER0_CH0_ON/PE8, TIMER0_CH1_ON/PE10, TIMER0_CH2_ON/PE12)
5:4	USART2_REMAP[1:0]	USART2 remapping These bits are set and cleared by software 00: No remap (USART2_TX/PB10, USART2_RX /PB11, USART2_CK/PB12, USART2_CTS/PB13, USART2_RTS/PB14) 01: Partial remap (USART2_TX/PC10, USART2_RX /PC11, USART2_CK/PC12, USART2_CTS/PB13, USART2_RTS/PB14) 10: Not used 11: Full remap (USART2_TX/PD8, USART2_RX /PD9, USART2_CK/PD10, USART2_CTS/PD11, USART2_RTS/PD12)

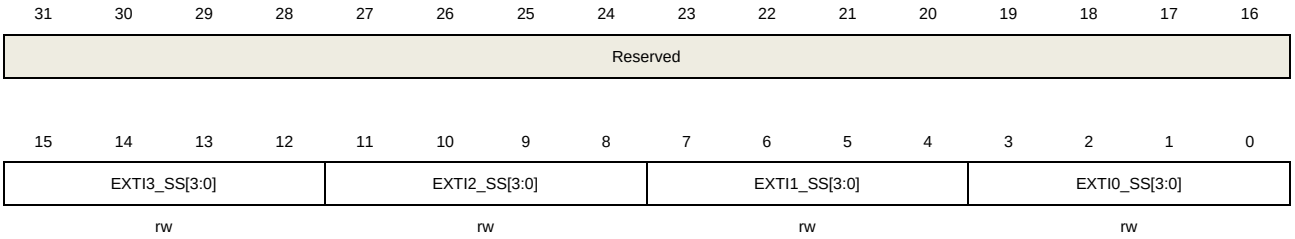
3	USART1_REMAP	USART1 remapping This bit is set and cleared by software 0: No remap (USART1_CTS/PA0, USART1_RTS/PA1,USART1_TX/PA2, USART1_RX /PA3, USART1_CK/PA4) 1: Remap (USART1_CTS/PD3, USART1_RTS/PD4,USART1_TX/PD5, USART1_RX /PD6, USART1_CK/PD7)
2	USART0_REMAP	USART0 remapping This bit is set and cleared by software 0: No remap (USART0_TX/PA9, USART0_RX /PA10) 1: Remap (USART0_TX/PB6, USART0_RX /PB7)
1	I2C0_REMAP	I2C0 remapping This bit is set and cleared by software 0: No remap (I2C0_SCL/PB6, I2C0_SDA /PB7) 1: Remap (I2C0_SCL/PB8, I2C0_SDA /PB9)
0	SPI0_REMAP	SPI0 remapping This bit is set and cleared by software 0: No remap (SPI0_NSS/PA4, SPI0_SCK /PA5, SPI0_MISO /PA6, SPI0_MOSI /PA7) 1: Remap (SPI0_NSS/PA15, SPI0_SCK /PB3, SPI0_MISO /PB4, SPI0_MOSI /PB5)

7.5.10. EXTI sources selection register 0 (AFIO_EXTISS0)

Address offset: 0x08

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15:12	EXTI3_SS[3:0]	EXTI 3 sources selection 0000: PA3 pin 0001: PB3 pin 0010: PC3 pin 0011: PD3 pin 0100: PE3 pin

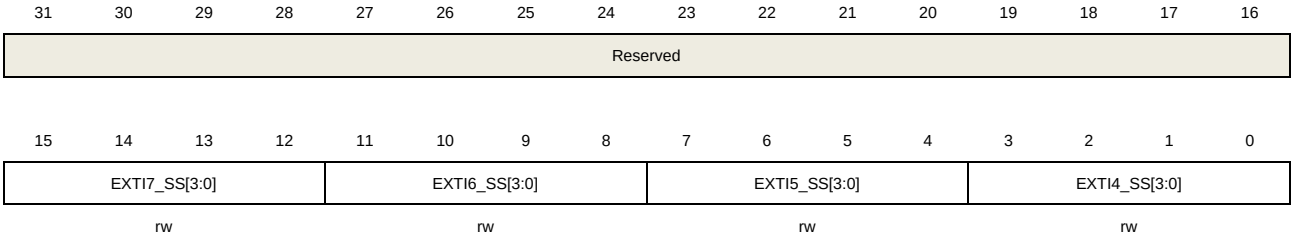
		Other configurations are reserved.
11:8	EXTI2_SS[3:0]	EXTI 2 sources selection 0000: PA2 pin 0001: PB2 pin 0010: PC2 pin 0011: PD2 pin 0100: PE2 pin Other configurations are reserved.
7:4	EXTI1_SS[3:0]	EXTI 1 sources selection 0000: PA1 pin 0001: PB1 pin 0010: PC1 pin 0011: PD1 pin 0100: PE1 pin Other configurations are reserved.
3:0	EXTI0_SS[3:0]	EXTI 0 sources selection 0000: PA0 pin 0001: PB0 pin 0010: PC0 pin 0011: PD0 pin 0100: PE0 pin Other configurations are reserved.

7.5.11. EXTI sources selection register 1 (AFIO_EXTISS1)

Address offset: 0x0C

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:12	EXTI7_SS[3:0]	EXTI 7 sources selection 0000: PA7 pin 0001: PB7 pin 0010: PC7 pin

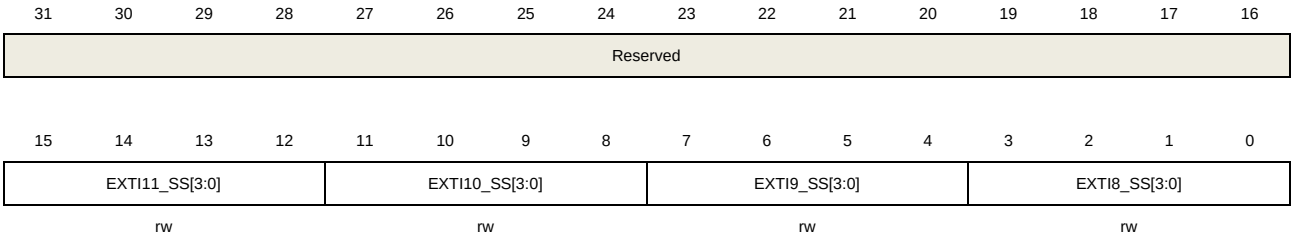
		0011: PD7 pin 0100: PE7 pin Other configurations are reserved.
11:8	EXTI6_SS[3:0]	EXTI 6 sources selection 0000: PA6 pin 0001: PB6 pin 0010: PC6 pin 0011: PD6 pin 0100: PE6 pin Other configurations are reserved.
7:4	EXTI5_SS[3:0]	EXTI 5 sources selection 0000: PA5 pin 0001: PB5 pin 0010: PC5 pin 0011: PD5 pin 0100: PE5 pin Other configurations are reserved.
3:0	EXTI4_SS[3:0]	EXTI 4 sources selection 0000: PA4 pin 0001: PB4 pin 0010: PC4 pin 0011: PD4 pin 0100: PE4 pin Other configurations are reserved.

7.5.12. EXTI sources selection register 2 (AFIO_EXTISS2)

Address offset: 0x10

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:12	EXTI11_SS[3:0]	EXTI 11 sources selection 0000: PA11 pin

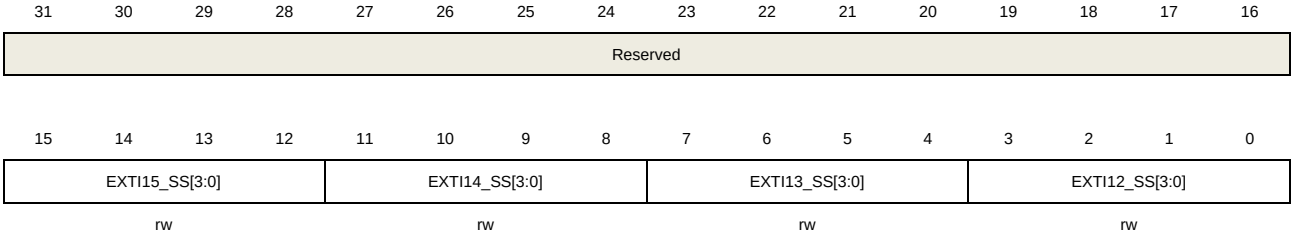
		0001: PB11 pin 0010: PC11 pin 0011: PD11 pin 0100: PE11 pin Other configurations are reserved.
11:8	EXTI10_SS[3:0]	EXTI 10 sources selection 0000: PA10 pin 0001: PB10 pin 0010: PC10 pin 0011: PD10 pin 0100: PE10 pin Other configurations are reserved.
7:4	EXTI9_SS[3:0]	EXTI 9 sources selection 0000: PA9 pin 0001: PB9 pin 0010: PC9 pin 0011: PD9 pin 0100: PE9 pin Other configurations are reserved.
3:0	EXTI8_SS[3:0]	EXTI 8 sources selection 0000: PA8 pin 0001: PB8 pin 0010: PC8 pin 0011: PD8 pin 0100: PE8 pin Other configurations are reserved.

7.5.13. EXTI sources selection register 3 (AFIO_EXTISS3)

Address offset: 0x14

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.

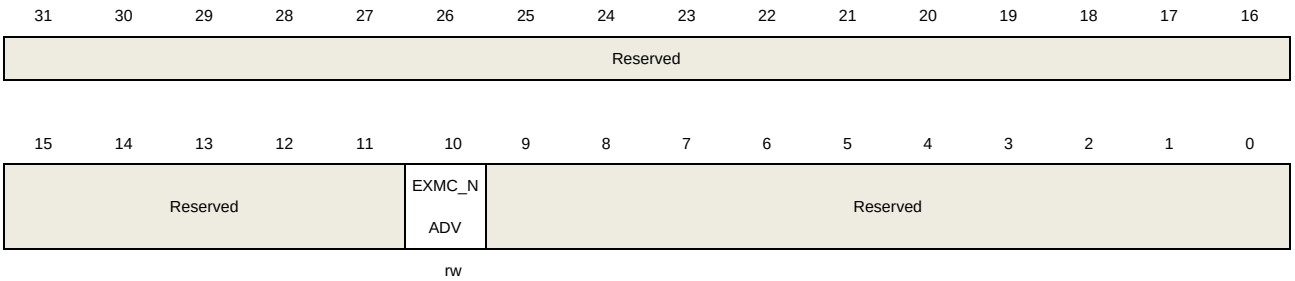
15:12	EXTI15_SS[3:0]	EXTI 15 sources selection 0000: PA15 pin 0001: PB15 pin 0010: PC15 pin 0011: PD15 pin 0100: PE15 pin Other configurations are reserved.
11:8	EXTI14_SS[3:0]	EXTI 14 sources selection 0000: PA14 pin 0001: PB14 pin 0010: PC14 pin 0011: PD14 pin 0100: PE14 pin Other configurations are reserved.
7:4	EXTI13_SS[3:0]	EXTI 13 sources selection 0000: PA13 pin 0001: PB13 pin 0010: PC13 pin 0011: PD13 pin 0100: PE13 pin Other configurations are reserved.
3:0	EXTI12_SS[3:0]	EXTI 12 sources selection 0000: PA12 pin 0001: PB12 pin 0010: PC12 pin 0011: PD12 pin 0100: PE12 pin Other configurations are reserved.

7.5.14. AFIO port configuration register 1 (AFIO_PCF1)

Address offset: 0x1C

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:11	Reserved	Must be kept at reset value.
10	EXMC_NADV	EXMC_NADV connect/disconnect This bit is set and cleared by software, it controls the use of optional EXMC_NADV signal. 0: The NADV signal is connected to the output(default) 1: The NADV signal is not connected. The I/O pin can be used by another peripheral.
9:0	Reserved	Must be kept at reset value.

8. Cyclic redundancy checks management unit (CRC)

8.1. Overview

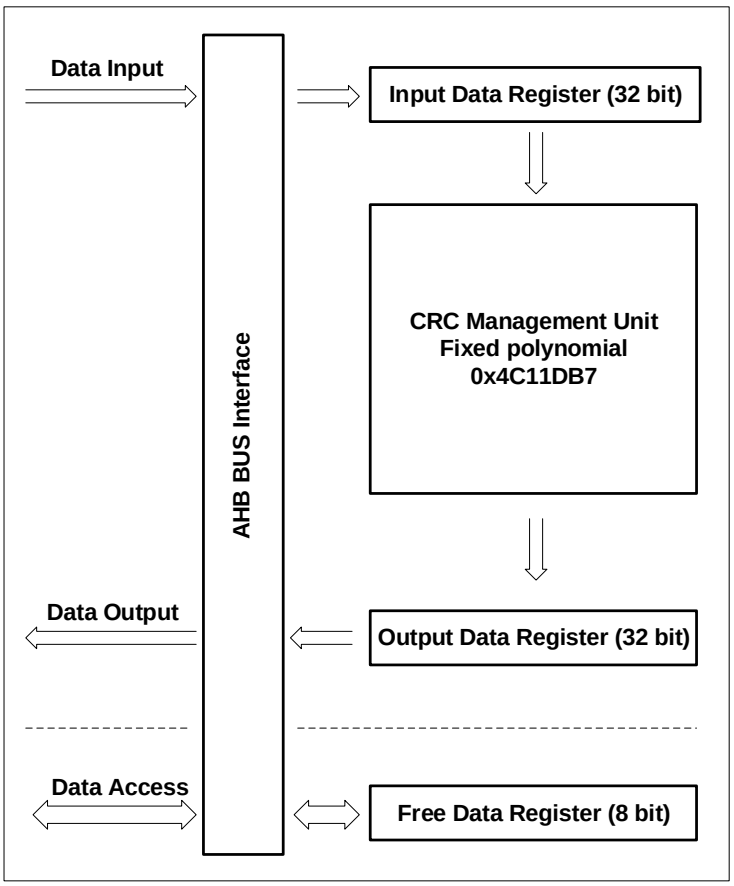
A cyclic redundancy checks (CRC) is an error-detecting code commonly used in digital networks and storage devices to detect accidental changes to raw data.

This CRC management unit can be used to calculate 32 bit CRC code with fixed polynomial.

8.2. Characteristics

- 32-bit data input and 32-bit data output. Calculation period is 4 AHB clock cycles for 32-bit input data size from data entered to the calculation result available.
- Free 8-bit register is unrelated to calculation and can be used for any other goals by any other peripheral devices.
- Fixed polynomial: 0x4C11DB7
  $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^{8}+X^{7}+X^{5}+X^{4}+X^{2}+X+1$
  This 32-bit CRC polynomial is a common polynomial used in Ethernet.

Figure 8-1. Block diagram of CRC management unit



8.3. Function overview

- CRC management unit is used to calculate the 32-bit raw data, and CRC_DATA register will receive the raw data and store the calculation result.

  If the CRC_DATA register has not been cleared by software setting the CRC_CTL register, the new input raw data will be calculated based on the result of previous value of CRC_DATA.

  During CRC calculation AHB will not be hanged because of the existence of the 32-bit input buffer.

- This module supplies an 8-bit free register CRC_FDATA.

  CRC_FDATA is unrelated to the CRC calculation, any value you write in will be read out at anytime.

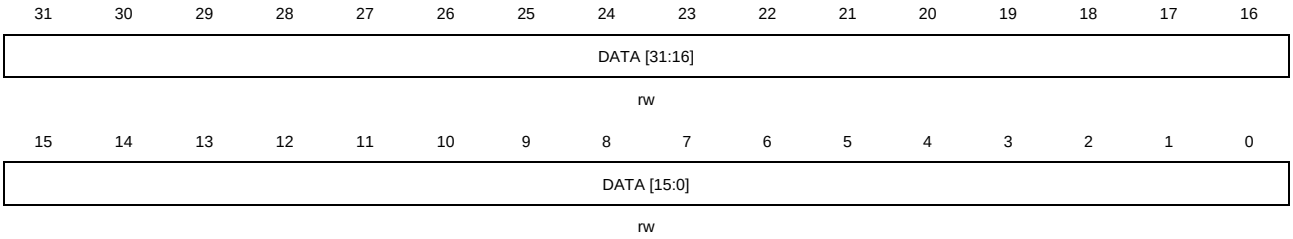
8.4. Register definition

CRC base address: 0x4002 3000

8.4.1. Data register (CRC_DATA)

Address offset: 0x00
Reset value: 0xFFFF FFFF

This register has to be accessed by word (32-bit).

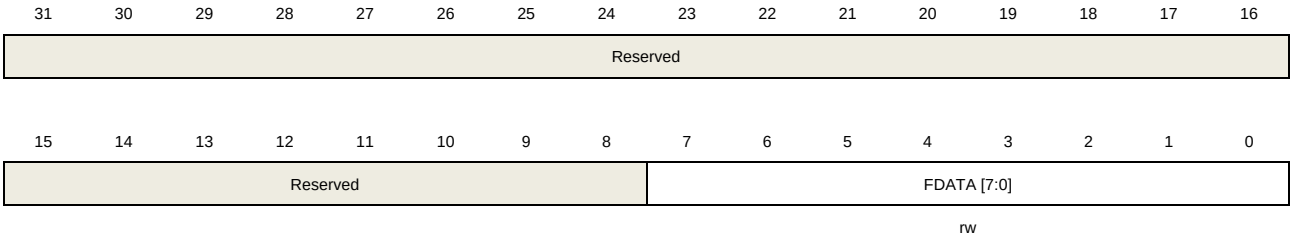


Bits	Fields	Descriptions
31:0	DATA [31:0]	CRC calculation result bits Software writes and reads. This register is used to calculate new data, and the register can be written the new data directly. Written value cannot be read because the read value is the previous CRC calculation result.

8.4.2. Free data register (CRC_FDATA)

Address offset: 0x04
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



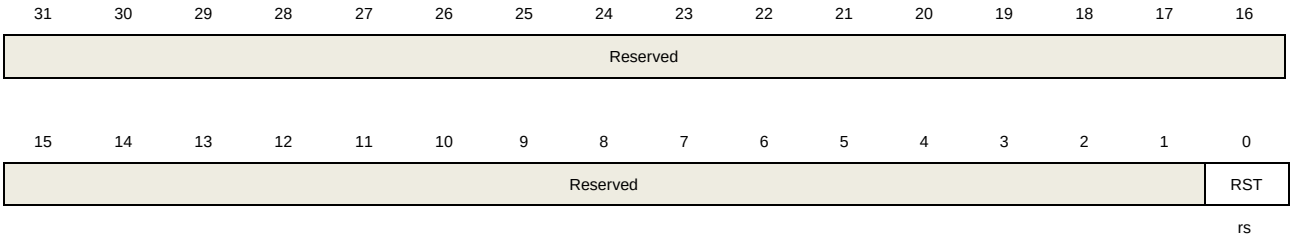
Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value.
7:0	FDATA [7:0]	Free Data Register bits Software writes and reads. These bits are unrelated with CRC calculation. This byte

can be used for any goal by any other peripheral. The CRC_CTL register will take no effect to the byte.

8.4.3. Control register (CRC_CTL)

Address offset: 0x08
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:1	Reserved	Must be kept at reset value.
0	RST	Set this bit can reset the CRC_DATA register to the value of 0xFFFFFFFF then automatically cleared itself to 0 by hardware. This bit will take no effect to CRC_FDATA. Software writes and reads.

9. Direct memory access controller (DMA)

9.1. Overview

The direct memory access (DMA) controller provides a hardware method of transferring data between peripherals and/or memory without intervention from the CPU, thereby freeing up bandwidth for other system functions. Data can be quickly moved by DMA between peripherals and memory as well as memory and memory without any CPU actions. There are 12 channels in the DMA controller (7 for DMA0 and 5 for DMA1). Each channel is dedicated to manage memory access requests from one or more peripherals. An arbiter is implemented inside to handle the priority among DMA requests.

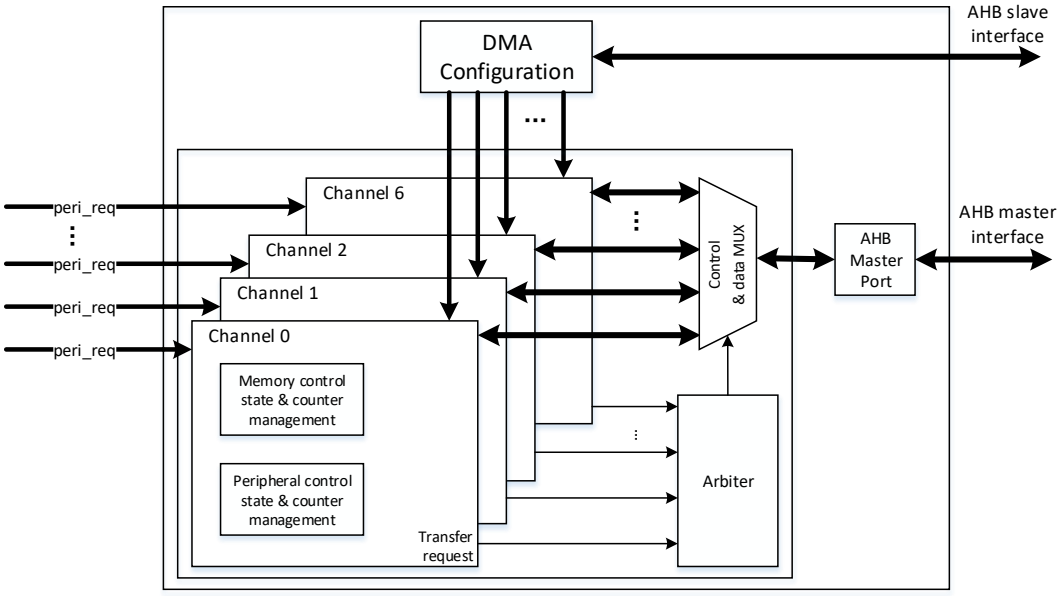
The system bus is shared by the DMA controller and the RISC-V core. When the DMA and the CPU are targeting the same destination, the DMA access may stop the CPU access to the system bus for some bus cycles. Round-robin scheduling is implemented in the bus matrix to ensure at least half of the system bus bandwidth for the CPU.

9.2. Characteristics

- Programmable length of data to be transferred, max to 65536.
- 12 channels and each channel are configurable (7 for DMA0 and 5 for DMA1).
- AHB and APB peripherals, FLASH, SRAM can be accessed as source and destination.
- Each channel is connected to fixed hardware DMA request.
- Software DMA channel priority (low, medium, high, ultra high) and hardware DMA channel priority (DMA channel 0 has the highest priority and DMA channel 6 has the lowest priority).
- Support independent 8, 16, 32-bit memory and peripheral transfer.
- Support independent fixed and increasing address generation algorithm of memory and peripheral.
- Support circular transfer mode.
- Support peripheral to memory, memory to peripheral, and memory to memory transfers.
- One separate interrupt per channel with three types of event flags.
- Support interrupt enable and clear.

9.3. Block diagram

Figure 9-1. Block diagram of DMA



As shown in ***Figure 9-1. Block diagram of DMA***, a DMA controller consists of four main parts:

- DMA configuration through AHB slave interface
- Data transmission through two AHB master interfaces for memory access and peripheral access
- An arbiter inside to manage multiple peripheral requests coming at the same time
- Channel management to control address/data selection and data counting

9.4. Function overview

9.4.1. DMA operation

Each DMA transfer consists of two operations, including the loading of data from the source and the storage of the loaded data to the destination. The source and destination addresses are computed by the DMA controller based on the programmed values in the DMA_CHxPADDR, DMA_CHxMADDR, and DMA_CHxCTL registers. The DMA_CHxCNT register controls how many transfers to be transmitted on the channel. The PWIDTH and MWIDTH bits in the DMA_CHxCTL register determine how many bytes to be transmitted in a transfer.

Suppose DMA_CHxCNT is 4, and both PNAGA and MNAGA are set. The DMA transfer operations for each combination of PWIDTH and MWIDTH are shown in the following ***Table 9-1. DMA transfer operation***.

Table 9-1. DMA transfer operation

Transfer size		Transfer operations

The CNT bits in the DMA_CHxCNT register control how many data to be transmitted on the channel and must be configured before enabling the CHEN bit in the register. During the transmission, the CNT bits indicate the remaining number of data items to be transferred.

The DMA transmission is disabled by clearing the CHEN bit in the DMA_CHxCTL register.

- If the DMA transmission is not completed when the CHEN bit is cleared, two situations may be occurred when restart this DMA channel:
  - If no register configuration operations of the channel occurs before restart the DMA channel, the DMA will continue to complete the rest of the transmission.
  - If any register configuration operations to DMA_CHxCNT, DMA_CHxPADDR or DMA_CHxMADDR of corresponding channel occur, the DMA will restart a new transmission.
- If the DMA transmission has been finished when clearing the CHEN bit, enable the DMA channel without any register configuration operation to DMA_CHxCNT, DMA_CHxPADDR or DMA_CHxMADDR of corresponding channel will not launch any DMA transfer.

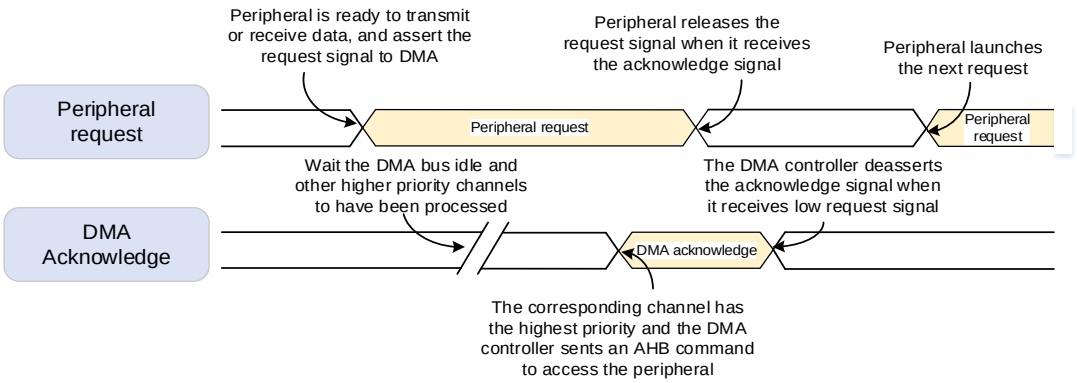
9.4.2. Peripheral handshake

To ensure a well-organized and efficient data transfer, a handshake mechanism is introduced between the DMA and peripherals, including a request signal and a acknowledge signal:

- Request signal asserted by peripheral to DMA controller, indicating that the peripheral is ready to transmit or receive data
- Acknowledge signal responded by DMA to peripheral, indicating that the DMA controller has initiated an AHB command to access the peripheral

Figure 9-2. Handshake mechanism shows how the handshake mechanism works between the DMA controller and peripherals.

Figure 9-2. Handshake mechanism



9.4.3. Arbitration

When two or more requests are received at the same time, the arbiter determines which request is served based on the priorities of channels. There are two-stage priorities, including the software priority and the hardware priority. The arbiter determines which channel is

selected to respond according to the following priority rules:

- Software priority: Four levels, including low, medium, high and ultra high by configuring the PRIO bits in the DMA_CHxCTL register.
- For channels with equal software priority level, priority is given to the channel with lower channel number.

9.4.4. Address generation

Two kinds of address generation algorithm are implemented independently for memory and peripheral, including the fixed mode and the increased mode. The PNAGA and MNAGA bit in the DMA_CHxCTL register are used to configure the next address generation algorithm of peripheral and memory.

In the fixed mode, the next address is always equal to the base address configured in the base address registers (DMA_CHxPADDR, DMA_CHxMADDR).

In the increasing mode, the next address is equal to the current address plus 1 or 2 or 4, depending on the transfer data width.

9.4.5. Circular mode

Circular mode is implemented to handle continue peripheral requests (for example, ADC scan mode). The circular mode is enabled by setting the CMEN bit in the DMA_CHxCTL register.

In circular mode, the CNT bits are automatically reloaded with the pre-programmed value and the full transfer finish flag is asserted at the end of every DMA transfer. DMA can always responds the peripheral request until the CHEN bit in the DMA_CHxCTL register is cleared.

9.4.6. Memory to memory mode

The memory to memory mode is enabled by setting the M2M bit in the DMA_CHxCTL register. In this mode, the DMA channel can also work without being triggered by a request from a peripheral. The DMA channel starts transferring as soon as it is enabled by setting the CHEN bit in the DMA_CHxCTL register, and completed when the DMA_CHxCNT register reaches zero.

9.4.7. Channel configuration

When starting a new DMA transfer, it is recommended to respect the following steps:

1. Read the CHEN bit and judge whether the channel is enabled or not. If the channel is enabled, clear the CHEN bit by software. When the CHEN bit is read as ‘0’, configuring and starting a new DMA transfer is allowed.
2. Configure the M2M bit and DIR bit in the DMA_CHxCTL register to set the transfer mode.

3. Configure the CMEN bit in the DMA_CHxCTL register to enable/disable the circular mode.
4. Configure the PRIO bits in the DMA_CHxCTL register to set the channel software priority.
5. Configure the memory and peripheral transfer width, memory and peripheral address generation algorithm in the DMA_CHxCTL register.
6. Configure the enable bit for full transfer finish interrupt, half transfer finish interrupt, transfer error interrupt in the DMA_CHxCTL register.
7. Configure the DMA_CHxPADDR register for setting the peripheral base address.
8. Configure the DMA_CHxMADDR register for setting the memory base address.
9. Configure the DMA_CHxCNT register to set the total transfer data number.
10. Configure the CHEN bit with '1' in the DMA_CHxCTL register to enable the channel.

9.4.8. Interrupt

Each DMA channel has a dedicated interrupt. There are three types of interrupt event, including full transfer finish, half transfer finish, and transfer error.

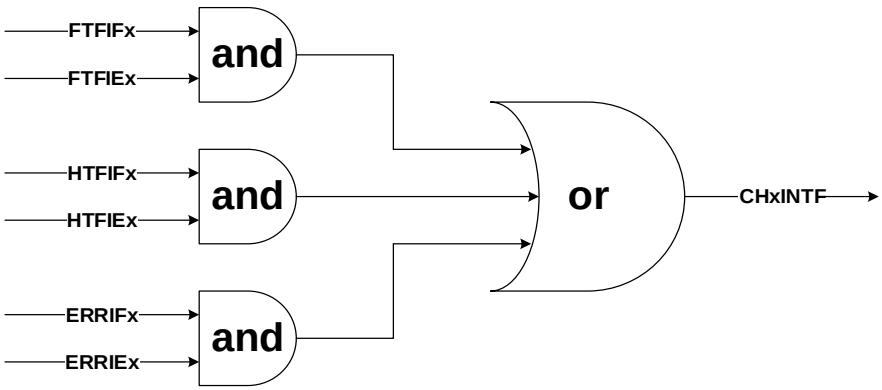
Each interrupt event has a dedicated flag bit in the DMA_INTF register, a dedicated clear bit in the DMA_INTC register, and a dedicated enable bit in the DMA_CHxCTL register. The relationship is described in the following ***Table 9-2. Interrupt events***.

Table 9-2. Interrupt events

Interrupt event	Flag bit	Clear bit	Enable bit
	DMA_INTF	DMA_INTC	DMA_CHxCTL
Full transfer finish	FTFIF	FTFIFC	FTFIE
Half transfer finish	HTFIF	HTFIFC	HTFIE
Transfer error	ERRIF	ERRIFC	ERRIE

The DMA interrupt logic is shown in the***Figure 9-3. DMA interrupt logic***, an interrupt can be produced when any type of interrupt event occurs and enabled on the channel.

Figure 9-3. DMA interrupt logic



Note: “x” indicates channel number (for DMA0, x=0…6, for DMA1, x=0…4).

9.4.9. DMA request mapping

Several requests from peripherals may be mapped to one DMA channel. They are logically ORed before entering the DMA. For details, see the following ***Figure 9-4. DMA0 request mapping*** and ***Figure 9-5. DMA1 request mapping***. The request of each peripheral can be independently enabled or disabled by programming the registers of the corresponding peripheral. The user has to ensure that only one request is enabled at a time on one channel. ***Table 9-3. DMA0 requests for each channel*** lists the support request from peripheral for each channel of DMA0, and ***Table 9-4. DMA1 requests for each channel*** lists the support request from peripheral for each channel of DMA1.

Figure 9-4. DMA0 request mapping

9.5.4. Channel x counter register (DMA_CHxCNT)

x = 0...6, where x is a channel number

Address offset: 0x0C + 0x14 × x
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CNT[15:0]
rw

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	CNT[15:0]	Transfer counter These bits can not be written when CHEN in the DMA_CHxCTL register is '1'. This register indicates how many transfers remain. Once the channel is enabled, it is read-only, and decreases after each DMA transfer. If the register is zero, no transaction can be issued whether the channel is enabled or not. Once the transmission of the channel is complete, the register can be reloaded automatically by the previously programmed value if the channel is configured in circular mode.

9.5.5. Channel x peripheral base address register (DMA_CHxPADDR)

x = 0...6, where x is a channel number

Address offset: 0x10 + 0x14 × x

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

Note: Do not configure this register when channel is enabled.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits	Fields	Descriptions
31:0	MADDR[31:0]	Memory base address These bits can not be written when CHEN in the DMA_CHxCTL register is ‘1’. When MWIDTH in the DMA_CHxCTL register is 01 (16-bit), the LSB of these bits is ignored. Access is automatically aligned to a half word address. When MWIDTH in the DMA_CHxCTL register is 10 (32-bit), the two LSBs of these bits are ignored. Access is automatically aligned to a word address.

10. Debug (DBG)

10.1. Overview

The GD32VF103 series provide a large variety of debug and test features. They are implemented with a standard configuration of the RISC-V module together with a daisy chained standard TAP controller. Debug functions are integrated into the RISC-V. The debug system supports standard JTAG debug. The debug refer to the following documents:

- RISC-V External Debug Support Version 0.13

The DBG hold unit helps debugger to debug power saving mode, TIMER, I2C, WWDGT, FWDGT and CAN. When corresponding bit is set, provide clock when in power saving mode or hold the state for TIMER, WWDGT, FWDGT, I2C or CAN.

10.2. JTAG function overview

Debug capabilities can be accessed by a debug tool via JTAG interface (JTAG - Debug Port).

10.2.1. Pin assignment

The JTAG interface provides 5-pin standard JTAG, known as JTAG clock (JTCK), JTAG mode selection (JTMS), JTAG data input (JTDI), JTAG data output (JTDO) and JTAG reset (NJTRST, active low).

The pin assignment are:

PA15: JTDI

PA14: JTCK

PA13: JTMS

PB4: NJTRST

PB3: JTDO

By default, 5-pin standard JTAG debug mode is chosen after reset. Users can also use JTAG function without NJTRST pin, then the PB4 can be used to other GPIO functions. (NJTRST tied to 1 by hardware). If JTAG not used, all 5-pin can be released to other GPIO functions. Please refer to ***GPIO pin configuration***.

10.2.2. JTAG daisy chained structure

The RISC-V JTAG TAP is connected to a Boundary-Scan (BSD) JTAG TAP. The BSD JTAG IR is 5-bit width, and the RISC-V JTAG IR is also 5-bit width.

The BSD JTAG IDCODE is 0x790007A3.

10.2.3. Debug reset

The JTAG-DP register are in the power on reset domain. The System reset initializes the majority of the RISC-V. The NJTRST reset can reset JTAG TAP controller only.

10.3. Debug hold function overview

10.3.1. Debug support for power saving mode

When STB_HOLD bit in DBG control register (DBG_CTL) is set and entering the standby mode, the clock of AHB bus and system clock are provided by CK_IRC8M, and the debugger can debug in standby mode. When exit the standby mode, a system reset generated.

When DSLP_HOLD bit in DBG control register (DBG_CTL) is set and entering the Deep-sleep mode, the clock of AHB bus and system clock are provided by CK_IRC8M, and the debugger can debug in Deep-sleep mode.

When SLP_HOLD bit in DBG control register (DBG_CTL) is set and entering the sleep mode, the clock of AHB bus for CPU is not closed, and the debugger can debug in sleep mode.

10.3.2. Debug support for TIMER, I2C, WWDGT, FWDGT and CAN

When the core halted and the corresponding bit in DBG control register (DBG_CTL) is set, the following behaved.

For TIMER, the timer counters stopped and hold for debug.

For I2C, SMBUS timeout hold for debug.

For WWDGT or FWDGT, the counter clock stopped for debug.

For CAN, the receive register stopped counting for debug.

10.4. Register definition

DBG base address: 0xE004 2000

10.4.1. ID code register (DBG_ID)

Address: 0xE004 2000

Read only

This register has to be accessed by word(32-bit)

0	SLP_HOLD	Sleep mode hold register This bit is set and reset by software 0: no effect 1: At the sleep mode, the clock of AHB is on.

11. Analog-to-digital converter (ADC)

11.1. Introduction

A 12-bit successive approximation analog-to-digital converter module(ADC) is integrated on the MCU chip, which can sample analog signals from 16 external channels and 2 internal channels. The 18 ADC sampling channels all support a variety of operation modes. After sampling and conversion, the conversion results can be stored in the corresponding data registers according to the least significant bit(LSB) alignment or the most significant(MSB) bit alignment. An on-chip hardware oversample scheme improves performances and reduces the computational burden of MCU.

11.2. Characteristics

- High performance
  - ADC sampling rsolution: 12-bit, 10-bit, 8-bit or 6-bit.
  - ADC sampling rate: 2 MSPs for 12-bit resolution.
  - Foreground calibration function.
  - Programmable sampling time.
  - Data storage mode: the most significant bit and the least significant bit.
  - DMA support.
- Analog input channels:
  - 16 external analog inputs.
  - 1 channel for internal temperature sensor (V_{SENSE}).
  - 1 channel for internal reference voltage (V_{REFINT}).
- Start-of-conversion can be initiated:
  - By software.
  - By hardware triggers.
- Operation modes:
  - Converts a single channel or scans a sequence of channels.
  - Single operation mode converts selected inputs once per trigger.
  - Continuous operation mode converts selected inputs continuously.
  - Discontinuous operation mode.
  - SYNC mode(the device with two or more ADCs).
- Conversion result threshold monitor function: analog watchdog.
- Interrupt generation：
  - at the end of routine conversions.
  - analog watchdog event.
- Oversampler:
  - 16-bit data register.
  - Oversampling ratio adjustable from 2 to 256x.

- Programmable data shift up to 8-bit.

- Channel input range: $V_{REF-} \leq V_{IN} \leq V_{REF+}$.

11.3. Pins and internal signals

Figure 11-1. ADC module block diagram shows the ADC block diagram. *Table 11-1. ADC internal input signals* and *Table 11-2. ADC input pins definition* gives the ADC pin description.

Table 11-1. ADC internal input signals

Internal signal name	Description
V_{SENSE}	Internal temperature sensor output voltage
V_{REFINT}	Internal voltage reference output voltage

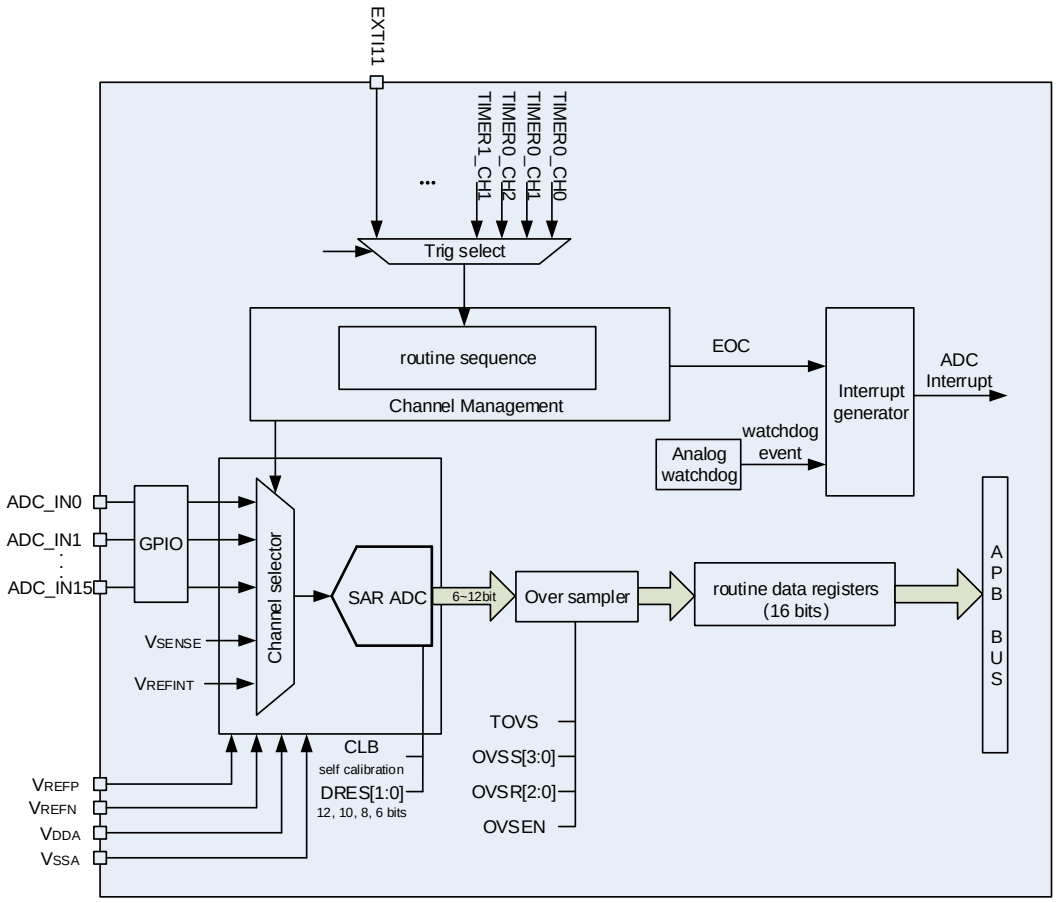
Table 11-2. ADC input pins definition

Name	Description
V_{DDA}	Analog power supply equal to V_{DD}
V_{SSA}	Ground for analog power supply equal to V_{SS}
V_{REF+}	The positive reference voltage for the ADC
V_{REF-}	The negative reference voltage for the ADC,V_{REF-} = V_{SSA}
ADCx_IN[15:0]	Up to 16 external channels

Note: The ADC_IN[15:0] should set as Analog Input mode.

11.4. Functional overview

Figure 11-1. ADC module block diagram



11.4.1. Foreground calibration function

During the foreground calibration procedure, the ADC calculates a calibration factor which is internally applied to the ADC until the next ADC power-off. The application must not use the ADC during calibration and must wait until it is completed. Calibration should be performed before starting A/D conversion. The calibration is initiated by software by setting bit CLB=1. CLB bit stays at 1 during all the calibration sequence. It is then cleared by hardware as soon as the calibration is completed.

When the ADC operating conditions change (such as supply power voltage V_{DDA}, positive reference voltage V_{REF+}, temperature and so on), it is recommended to re-run a calibration cycle.

The internal analog calibration can be reset by setting the RSTCLB bit in ADC_CTL1 register.

Calibration software procedure:

1. Ensure that ADCON=1.
2. Delay 14 CK_ADC to wait for ADC stability.

3. Set RSTCLB (optional).
4. Set CLB=1.
5. Wait until CLB=0.

11.4.2. ADC clock

The CK_ADC clock is synchronous with the AHB and APB2 clock and provided by the clock controller. ADC clock can be divided and configured by RCU controller.

11.4.3. ADCON enable

The ADCON bit on the ADC_CTL1 register is the enable switch of the ADC module. The ADC module will keep in reset state if this bit is 0. For power saving, when this bit is reset, the analog sub-module will be put into power-down mode. After ADC is enabled, you need delay t_{SU} time for sampling, the value of t_{SU} please refer to the device datasheet.

11.4.4. Routine sequence

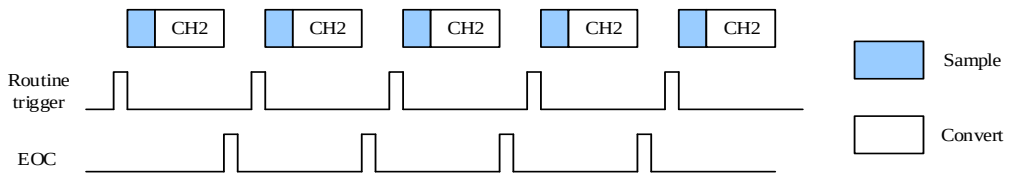
The channel management circuit can organize the sampling conversion channels into a sequence: routine sequence. The routine sequence supports up to 16 channels, and each channel is called routine channel. The RL[3:0] bits in the ADC_RSQ0 register specify the total conversion sequence length. The ADC_RSQ0~ADC_RSQ2 registers specify the selected channels of the routine sequence.

11.4.5. Operation modes

Single operation mode

In the single operation mode, the ADC performs conversion on the channel specified in the RSQ0[4:0] bits of ADC_RSQ2 at a routine trigger. When the ADCON has been set high, the ADC samples and converts a single channel, once the corresponding software trigger or external trigger is active.

Figure 11-2. Single operation mode



After conversion of a single routine channel, the conversion data will be stored in the ADC_RDATA register, the EOC will be set. An interrupt will be generated if the EOCIE bit is set.

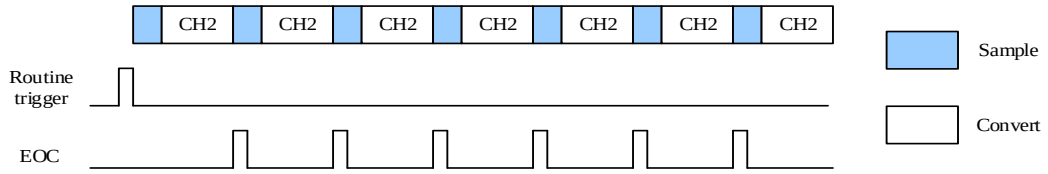
Software procedure for single operation mode of a routine channel:

1. Make sure the DISRC, SM in the ADC_CTL0 register and CTN bit in the ADC_CTL1 register are reset.
2. Configure RSQ0 with the analog channel number.
3. Configure ADC_SAMPTx register.
4. Configure ETERC and ETSRC bits in the ADC_CTL1 register if in need.
5. Set the SWRCST bit, or generate an external trigger for the routine sequence.
6. Wait the EOC flag to be set.
7. Read the converted data in the ADC_RDATA register.
8. Clear the EOC flag by writing 0 to it.

Continuous operation mode

The continuous operation mode will be enabled when CTN bit in the ADC_CTL1 register is set. In this mode, the ADC performs conversion on the channel specified in the RSQ0[4:0]. When the ADCON has been set high, the ADC samples and converts specified channel, once the corresponding software trigger or external trigger is active. The conversion data will be stored in the ADC_RDATA register.

Figure 11-3. Continuous operation mode



Software procedure for continuous operation mode on a routine channel:

1. Set the CTN bit in the ADC_CTL1 register.
2. Configure RSQ0 with the analog channel number.
3. Configure ADC_SAMPTx register.
4. Configure ETERC and ETSRC bits in the ADC_CTL1 register if in need.
5. Set the SWRCST bit, or generate an external trigger for the routine sequence.
6. Wait the EOC flag to be set.
7. Read the converted data in the ADC_RDATA register.
8. Clear the EOC flag by writing 0 to it.
9. Repeat steps 6~8 as soon as the conversion is in need.

To get rid of checking, DMA can be used to transfer the converted data:

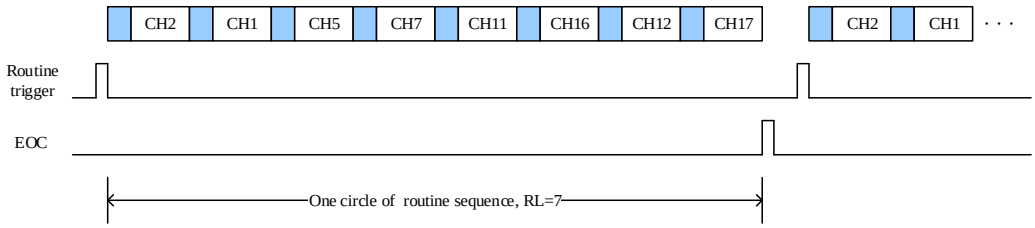
1. Set the CTN and DMA bit in the ADC_CTL1 register.
2. Configure RSQ0 with the analog channel number.
3. Configure ADC_SAMPTx register.
4. Configure ETERC and ETSRC bits in the ADC_CTL1 register if in need.
5. Prepare the DMA module to transfer data from the ADC_RDATA.
6. Set the SWRCST bit, or generate an external trigger for the routine sequence.

Scan operation mode

The scan operation mode will be enabled when SM bit in the ADC_CTL0 register is set. In this mode, the ADC performs conversion on all channels with a specific routine sequence specified in the ADC_RSQ0~ADC_RSQ2 registers. When the ADCON has been set high, the ADC samples and converts specified channels one by one in the routine sequence till the end of the sequence, once the corresponding software trigger or external trigger is active. The conversion data will be stored in the ADC_RDATA register. After conversion of theroutine sequence, the EOC will be set. An interrupt will be generated if the EOCIE bit is set. The DMA bit in ADC_CTL1 register must be set when the routine sequence works in scan mode.

After conversion of aroutine sequence, the conversion can be restarted automatically if the CTN bit in the ADC_CTL1 register is set.

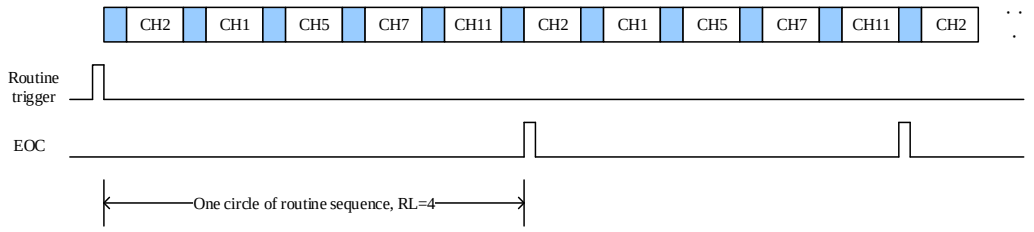
Figure 11-4. Scan operation mode, continuous disable



Software procedure for scan operation mode on aroutine sequence:

1. Set the SM bit in the ADC_CTL0 register and the DMA bit in the ADC_CTL1 register.
2. Configure ADC_RSQx and ADC_SAMPTx registers.
3. Configure ETERC and ETSRC bits in the ADC_CTL1 register if in need.
4. Prepare the DMA module to transfer data from the ADC_RDATA.
5. Set the SWRCST bit, or generate an external trigger for the routine sequence.
6. Wait the EOC flag to be set.
7. Clear the EOC flag by writing 0 to it.

Figure 11-5. Scan operation mode, continuous enable

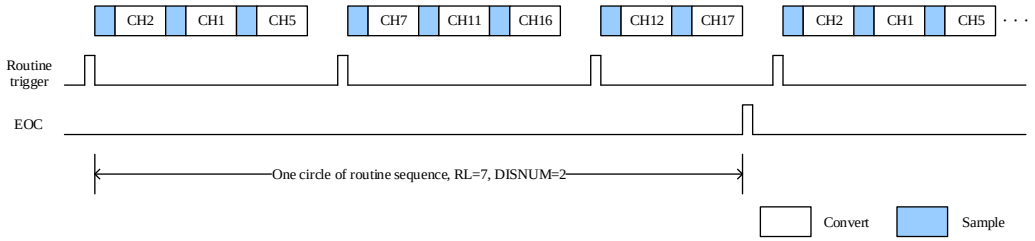


Discontinuous operation mode

The discontinuous operation mode will be enabled when DISRC bit in the ADC_CTL0 register is set. In this mode, the ADC performs a short sequence of n conversions (n does not exceed 8) which is a part of the sequence of conversions selected in the ADC_RSQ0~ADC_RSQ2 registers. The value of n is configured by the DISNUM[2:0] bits in the ADC_CTL0 register. When the corresponding software trigger or external trigger is active, the ADC samples and

converts the next n channels configured in the ADC_RSQ0~ADC_RSQ2 registers until all the channels of routine sequence are done. The EOC will be set after every circle of the routine sequence. An interrupt will be generated if the EOCIE bit is set.

Figure 11-6. Discontinuous operation mode



Software procedure for discontinuous operation mode on a routine sequence:

1. Set the DISRC bit in the ADC_CTL0 register and the DMA bit in the ADC_CTL1 register.
2. Configure DISNUM[2:0] bits in the ADC_CTL0 register.
3. Configure ADC_RSQx and ADC_SAMPTx registers.
4. Configure ETERC and ETSRC bits in the ADC_CTL1 register if in need.
5. Prepare the DMA module to transfer data from the ADC_RDATA (refer to the spec of the DMA module).
6. Set the SWRCST bit, or generate an external trigger for the routine sequence.
7. Repeat step6 if in need.
8. Wait the EOC flag to be set.
9. Clear the EOC flag by writing 0 to it.

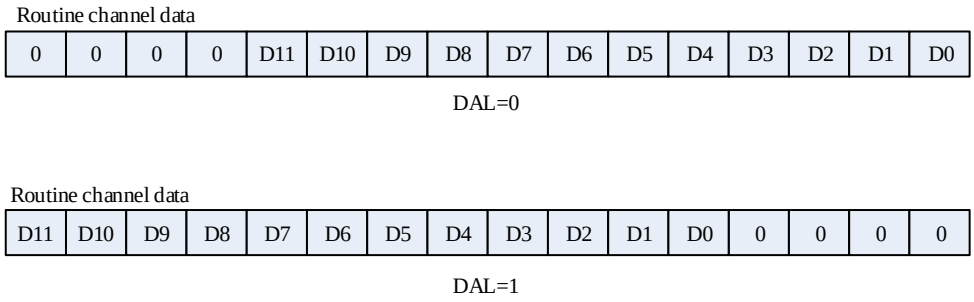
11.4.6. Conversion result threshold monitor function

The analog watchdog is enabled when the RWDEN bit in the ADC_CTL0 register is set for routine sequence. This function is used to monitor whether the conversion result exceeds the set thresholds, and the WDE bit in ADC_STAT register will be set. An interrupt will be generated if the WDEIE bit is set. The ADC_WDHT and ADC_WDLT registers are used to specify the high and low threshold. The comparison is done before the alignment, so the threshold values are independent of the alignment, which is specified by the DAL bit in the ADC_CTL1 register. One or more channels, which are select by the RWDEN, WDSC and WDCHSEL[4:0] bits in ADC_CTL0 register, can be monitored by the analog watchdog.

11.4.7. Data storage mode

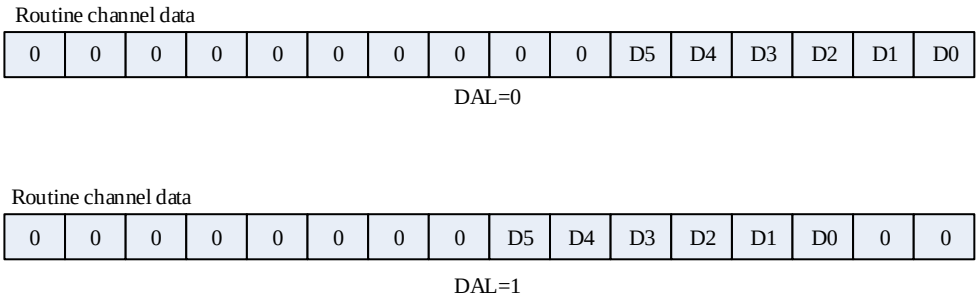
The alignment of data stored after conversion can be specified by DAL bit in the ADC_CTL1 register.

Figure 11-7. 12-bit Data storage mode



6-bit resolution data storage mode is different from 12-bit/10-bit/8-bit resolution data storage mode, shown as ***Figure 11-8. 6-bit Data storage mode*** .

Figure 11-8. 6-bit Data storage mode



11.4.8. Sample time configuration

The number of CK_ADC cycles which is used to sample the input voltage can be specified by the SPTn[2:0] bits in the ADC_SAMPT0 and ADC_SAMPT1 registers. A different sample time can be specified for each channel. For 12-bits resolution, the total sampling and conversion time is “sampling time + 12.5” CK_ADC cycles.

Example:

CK_ADC = 10MHz and sample time is 1.5 cycles, the total conversion time is “1.5+12.5” CK_ADC cycles, that means 1.4us.

11.4.9. External trigger configuration

The conversion of routine sequence can be triggered by rising edge of external trigger inputs. The external trigger source of routine sequence is controlled by the ETSRC[2:0] bits in the ADC_CTL1 register.

Table 11-3. External trigger source for ADC0 and ADC1

ETSRC[2:0]	Trigger Source	Trigger Type
000	TIMER0_CH0	Hardware trigger
001	TIMER0_CH1	
010	TIMER0_CH2	

ETSRC[2:0]	Trigger Source	Trigger Type
011	TIMER1_CH1	
100	TIMER2_TRGO	
101	TIMER3_CH3	
110	EXTI11	
111	SWRCST	Software trigger

11.4.10. DMA request

The DMA request, which is enabled by the DMA bit of ADC_CTL1 register, is used to transfer data of routine sequence for conversion of more than one channel. The ADC generates a DMA request at the end of conversion of a routine channel. When this request is received, the DMA will transfer the converted data from the ADC_RDATA register to the destination location which is specified by the user.

11.4.11. ADC internal channels

When the TSVREN bit of ADC_CTL1 register is set, the temperature sensor channel (ADC0_CH16) and V_{REFINT} channel (ADC0_CH17) is enabled. The temperature sensor can be used to measure the ambient temperature of the device. The sensor output voltage can be converted into a digital value by ADC. The sampling time for the temperature sensor is recommended to be set to at least t_{s_temp} µs (please refer to the datasheet). When this sensor is not in use, it can be put in power down mode by resetting the TSVREN bit.

The output voltage of the temperature sensor changes linearly with temperature. Because there is an offset, which is up to 45 °C and varies from chip to chip due to the chip production process variation, the internal temperature sensor is more appropriate to detect temperature variations instead of absolute temperature. When it is used to detect accurate temperature, an external temperature sensor part should be used to calibrate the offset error.

The internal voltage reference (V_{REFINT}) provides a stable (bandgap) voltage output for the ADC and Comparators. V_{REFINT} is internally connected to the ADC0_CH17 input channel.

To use the temperature sensor:

1. Configure the conversion sequence (ADC_IN16) and the sampling time(17.1µs) for the channel.
2. Enable the temperature sensor by setting the TSVREN bit in the ADC control register 1 (ADC_CTL1).
3. Start the ADC conversion by setting the ADCON bit or by the triggers.
4. Read the internal temperature sensor output voltage ($V_{temperature}$), and get the temperature with the following equation:

$$\text{Temperature (°C)} = \{(V_{25} - V_{temperature}) / \text{Avg\_Slope}\} + 25.$$

V_{25}: internal temperature sensor output voltage at 25°C, the typical value please refer to the datasheet.

Avg_Slope: Average slope for curve between temperature vs. internal temperature sensor output voltage, the typical value please refer to the datasheet.

11.4.12. Programmable resolution (DRES)

The resolution is configured by programming the DRES[1:0] bits in the ADC_OVSAMPCTL register. For applications that do not require high data accuracy, lower resolution allows faster conversion time. The DRES[1:0] bits must only be changed when the ADCON bit is reset. Lower resolution reduces the conversion time needed for the successive approximation steps as shown in ***Table 11-4. tCONV timings depending on resolution*** .

Table 11-4. t_{CONV} timings depending on resolution

DRES[1:0] bits	t_{CONV} (ADC clock cycles)	t_{CONV}(ns) at f_{ADC}=14MHz	t_{SMPL}(min) (ADC clock cycles)	t_{ADC} (ADC clock cycles)	t_{ADC}(us) at f_{ADC}=14MHz
12	12.5	893 ns	1.5	14	1000 ns
10	10.5	750 ns	1.5	12	857 ns
8	8.5	607 ns	1.5	10	714 ns
6	6.5	464 ns	1.5	8	571 ns

11.4.13. On-chip hardware oversampling

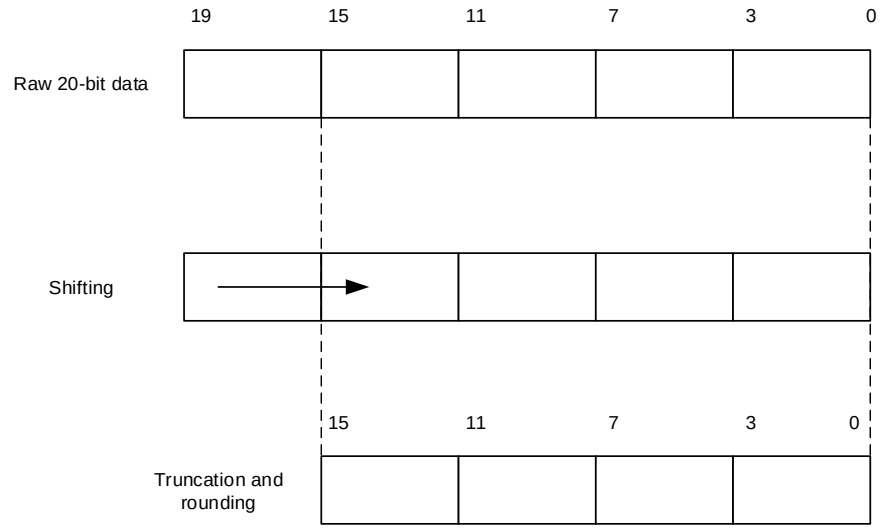
The on-chip hardware oversampling circuit performs data preprocessing to offload the CPU. It can handle multiple conversions and average them into a single data with increased data width, up to 16-bit. The on-chip hardware oversampling circuit is enabled by OVSEN bit in the ADC_OVSAMPCTL register. It provides a result with the following form, where N and M can be adjusted, and $D_{out}(n)$ is the n-th output digital signal of the ADC:

$$\text{Result} = \frac{1}{M} * \sum_{n=0}^{N-1} D_{out}(n) \quad (11\text{-}1)$$

The on-chip hardware oversampling circuit performs the following functions: summing and bit right shifting. The oversampling ratio N is defined by the OVSR[2:0] bits in the ADC_OVSAMPCTL register. It can range from 2x to 256x. The division coefficient M means bit right shifting up to 8-bit. It is configured through the OVSS[3:0] bits in the ADC_OVSAMPCTL register.

Summation units can produce up to 20 bits (256 x 12-bit), which is first shifted right. The upper bits of the result are then truncated, keeping only the 16 least significant bits rounded to the nearest value using the least significant bits left apart by the shifting, before being finally transferred into the data register.

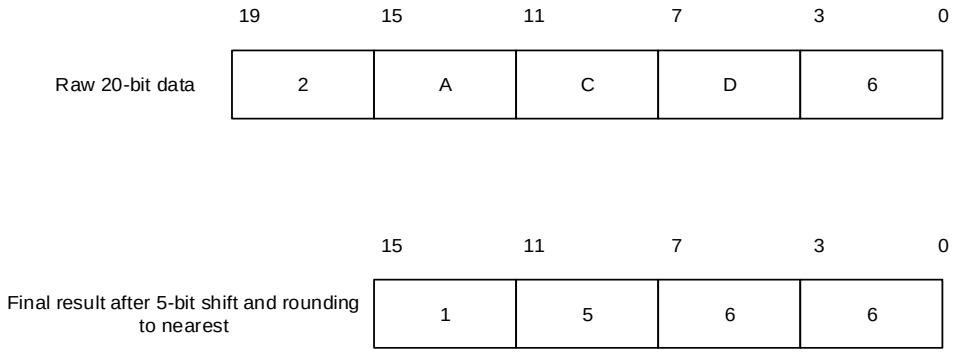
Figure 11-9. 20-bit to 16-bit result truncation



Note: If the intermediate result after the shifting exceeds 16 bits, the upper bits of the result are simply truncated.

Figure 11-10. Numerical example with 5-bits shift and rounding shows a numerical example of the processing, from a raw 20-bit accumulated data to the final 16-bit result.

Figure 11-10. Numerical example with 5-bits shift and rounding



The ***Table 11-5. Maximum output results vs N and M (Grayed values indicates truncation)*** below gives the data format for the various N and M combination, for a raw conversion data equal to 0xFFF.

Table 11-5. Maximum output results vs N and M (Grayed values indicates truncation)

Oversampling ratio	Max Raw data	No-shift OVSS=0000	1-bit shift OVSS=0001	2-bit shift OVSS=0010	3-bit shift OVSS=0011	4-bit shift OVSS=0100	5-bit shift OVSS=0101	6-bit shift OVSS=0110	7-bit shift OVSS=0111	8-bit shift OVSS=1000
2x	0x1FFE	0x1FFE	0x0FFF	0x07FF	0x03FF	0x01FF	0x00FF	0x007F	0x003F	0x001F

4x	0x3FFC	0x3FFC	0x1FFE	0x0FFF	0x07FF	0x03FF	0x01FF	0x00FF	0x007F	0x003F
8x	0x7FF8	0x7FF8	0x3FFC	0x1FFE	0x0FFF	0x07FF	0x03FF	0x01FF	0x00FF	0x007F
16x	0xFFF0	0xFFF0	0x7FF8	0x3FFC	0x1FFE	0x0FFF	0x07FF	0x03FF	0x01FF	0x00FF
32x	0x1FFE0	0xFFE0	0xFFF0	0x7FF8	0x3FFC	0x1FFE	0x0FFF	0x07FF	0x03FF	0x01FF
64x	0x3FFC0	0xFFC0	0xFFE0	0xFFF0	0x7FF8	0x3FFC	0x1FFE	0x0FFF	0x07FF	0x03FF
128x	0x7FF80	0xFF80	0xFFC0	0xFFE0	0xFFF0	0x7FF8	0x3FFC	0x1FFE	0x0FFF	0x07FF
256x	0xFFF00	0xFF00	0xFF80	0xFFC0	0xFFE0	0xFFF0	0x7FF8	0x3FFC	0x1FFE	0x0FFF

The conversion timings in oversampled mode do not change compared to standard conversion mode: the sampling time remains equal throughout the oversampling sequence. New data is supplied every N conversions, and the equivalent delay is equal to:

$$N \times t_{ADC} = N \times (t_{SMPL} + t_{CONV}) \quad (11\text{-}2)$$

11.5. ADC sync mode

In devices with more than one ADC, the ADC sync mode can be used. In ADC sync mode, the conversion starts alternately or simultaneously triggered by ADC0 to ADC1, according to the sync mode configurated by the SYNCM[3:0] bits in ADC1_CTL0 register.

In sync mode, when configure the conversion which is triggered by an external event, the ADC1 must be configured as triggered by the software. However, the external trigger must be enabled for ADC0 and ADC1.

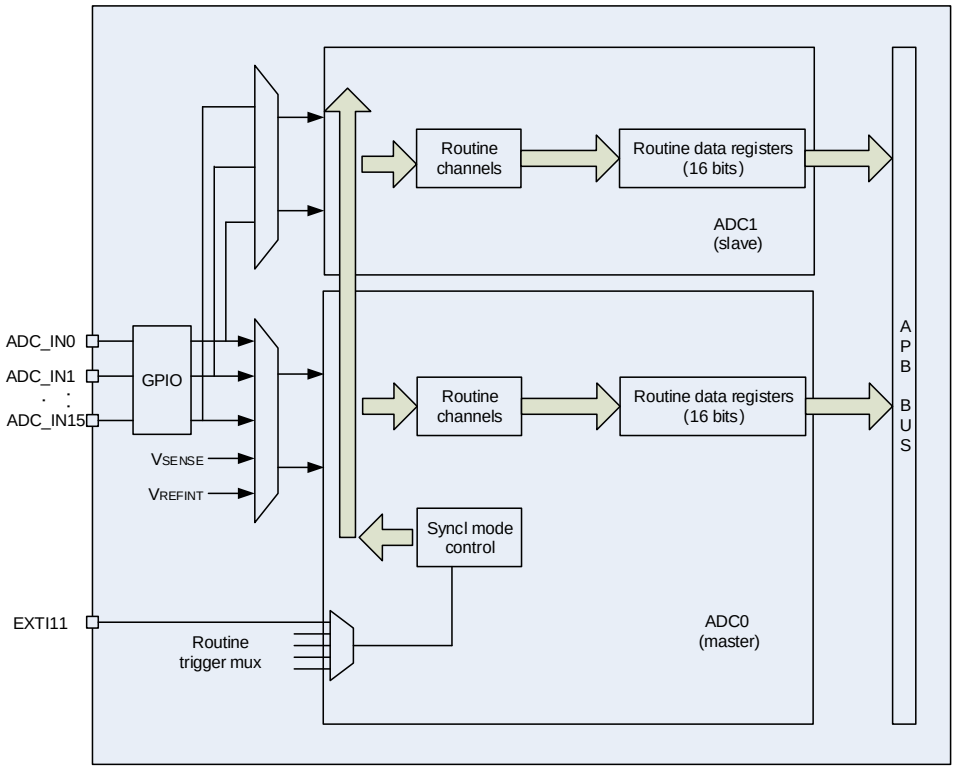
The following modes can be configured in ***Table 11-6. ADC sync mode table***.

Table 11-6. ADC sync mode table

SYNCM[2: 0]	mode
0000	Free mode
0110	Routine parallel mode
0111	Routine follow-up fast mode
1000	Routine follow-up slow mode

In ADC sync mode, the DMA bit must be set even if it is not used; the converted data of ADC1 routine channel can be read from the ADC0 data register.

Figure 11-11. ADC sync block diagram



11.5.1. Free mode

In this mode, each ADC works independently and does not interfere with each other.

11.5.2. Routine parallel mode

This mode converts the routine sequence simultaneously. The source of external trigger comes from the ADC0 routine sequence (configured by the ETSRC[2:0] bits in the ADC_CTL1 register) , and ADC1 routine sequence is configured as software trigger mode.

At the end of conversion event on ADC0 or ADC1, an EOC interrupt is generated (if enabled on one of the two ADC interrupt) when the ADC0/ADC1 routine channels are all converted. The behavior of routine parallel mode shows in the ***Figure 11-12. Routine parallel mode on 10 channels***.

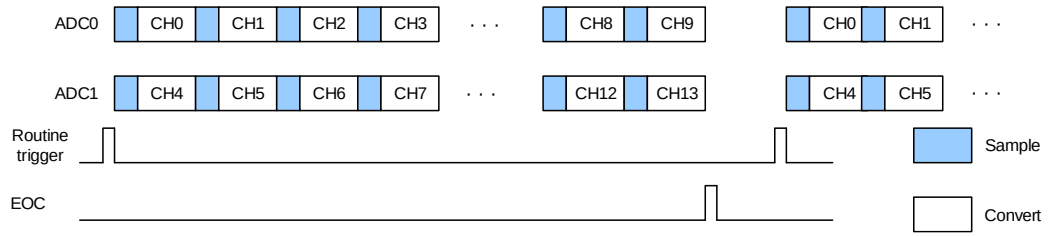
A 32-bit DMA is used, which transfers ADC_RDATA 32-bit register (the ADC_RDATA 32-bit register containing the ADC1 converted data in the [31: 16] bits field and the ADC0 converted data in the [15: 0] bits field) to SRAM.

Note:

1. If two ADCs use the same sampling channel, it should be ensured that the channel is not used at the same time.
2. Two channels sampled by two ADCs at the same time should be configured with the same

sampling time.

Figure 11-12. Routine parallel mode on 10 channels



11.5.3. Routine follow-up fast mode

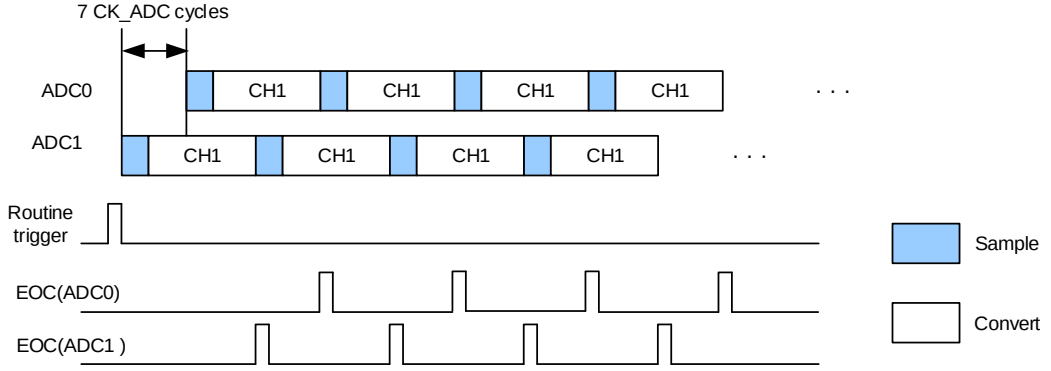
The routine follow-up fast mode is applicable to samplethe same channel of two ADCs The source of external trigger comes from the ADC0 routine channel (selected by the ETSRC[2:0] bits in the ADC_CTL1 register). When the trigger occurs, ADC1 runs immediately and ADC0 runs after 7 ADC clock cycles.

If the continuous mode is enabled for both ADC0 and ADC1, the selected routine channels of two ADCs are continuously converted. The behavior of follow-up fast mode shows in the ***Figure 11-13. Routine follow-up fast mode (the CTN bit of ADCs are set)***.

After an EOC interrupt is generated by ADC0 in case of setting the EOCIE bit, we can use a 32-bit DMA, which transfers to SRAM the ADC_RDATA register containing the ADC1 converted data in the [31: 16] bits field and the ADC0 converted data in the [15: 0] bits field.

Note: The sampling time of the routine channel of the two ADCs should be less than 7 ADC clock cycles.

Figure 11-13. Routine follow-up fast mode (the CTN bit of ADCs are set)



11.5.4. Routine follow-up slow mode

The routine follow-up slow mode is applicable to sample the same channel of two ADCs. The source of external trigger comes from the ADC0 routine channel (selected by the ETSRC[2:0] bits in the ADC_CTL1 register). When the trigger occurs, ADC1 runs immediately, ADC0 runs after 14 ADC clock cycles, after the second 14 ADC clock cycles the ADC1 runs again.

Continuous mode can't be used in this mode, because it continuously converts the routine

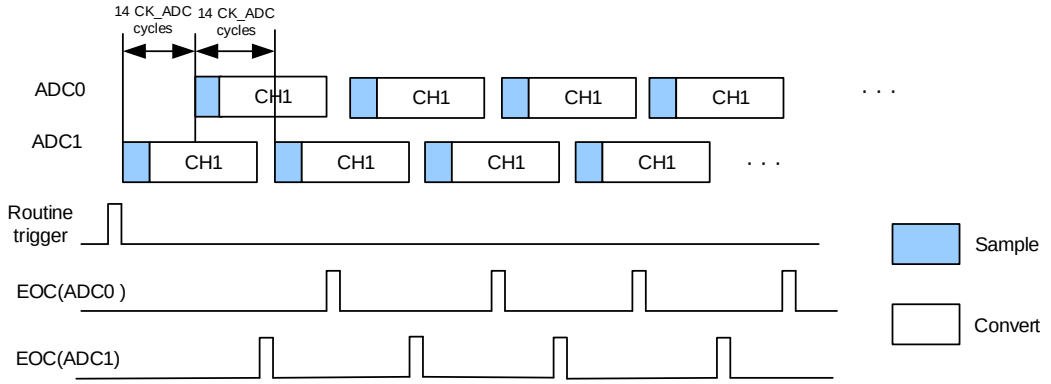
channel. The behavior of follow-up slow mode shows in the

***Figure 11-14. Routine follow-up slow* mode**.

After an EOC interrupt is generated by ADC0 (if EOCIE bit is set), we can use a 32-bit DMA, which transfers to SRAM the ADC_RDATA register containing the ADC1 converted data in the [31: 16] bits field and the ADC0 converted data in the [15: 0] bits field.

Note: The maximum sampling time allowed is <14 CK_ADC cycles to avoid the overlap between ADC0 and ADC1 sampling phases in the event that they convert the same channel.

Figure 11-14. Routine follow-up slow mode



11.6. ADC interrupts

The interrupt can be produced on one of the events:

- End of conversion for routine sequence
- The analog watchdog event

11.7. ADC registers

ADC0 base address: 0x4001 2400

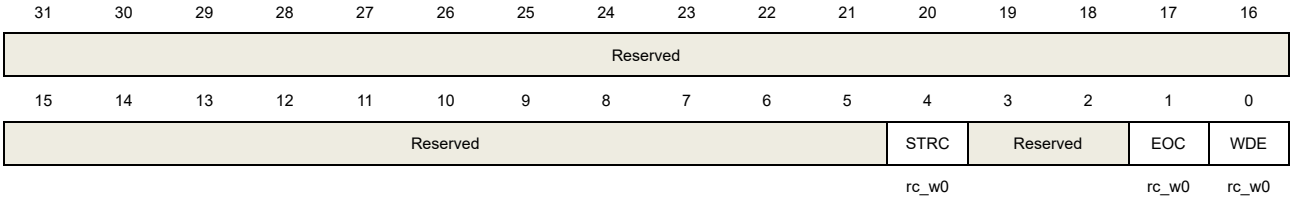
ADC1 base address: 0x4001 2800

11.7.1. Status register (ADC_STAT)

Address offset: 0x00

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit)



Bits	Fields	Descriptions
31:5	Reserved	Must be kept at reset value
4	STRC	Start flag of routine sequence conversion 0: Conversion is not started 1: Conversion is started Set by hardware when routine sequenceconversion starts. Cleared by software writing 0 to it.
3:2	Reserved	Must be kept at reset value.
1	EOC	End flag of routine sequence conversion 0: No end of routine sequence conversion 1: End ofroutine sequence conversion Set by hardware at the end of a routine sequence conversion. Cleared by software writing 0 to it or by reading the ADC_RDATA register.
0	WDE	Analog watchdog event flag 0: No analog watchdog event 1: Analog watchdog event Set by hardware when the converted voltage crosses the values programmed in the ADC_WDLT and ADC_WDHT registers. Cleared by software writing 0 to it.

11.7.2. Control register 0 (ADC_CTL0)

Address offset: 0x04

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	Reserved	Must be kept at reset value.
0	OVSEN	Oversampler Enable This bit is set and cleared by software. 0: Oversampler disabled 1: Oversampler enabled **Note:** The software allows this bit to be written only when ADCON = 0 (this ensures that no conversion is in progress).

12. Digital-to-analog converter (DAC)

12.1. Overview

The Digital-to-analog converter converts 12-bit digital data to a voltage on the external pins. The digital data can be configured to 8-bit or 12-bit mode, left-aligned or right-aligned mode. DMA can be used to update the digital data on external triggers.

The output voltage can be optionally buffered for higher drive capability.

The DAC channels can work independently or concurrently.

12.2. Characteristics

- 8-bit or 12-bit resolution.
- Left or right data alignment.
- DMA capability for each channel.
- Conversion update synchronously.
- Conversion triggered by external triggers.
- Configurable internal buffer.
- Extern voltage reference, V_{REFP}.
- Noise wave generation (LFSR noise mode and triangle noise mode).
- Two DAC channels in concurrent mode.

Figure 12-1. DAC block diagram and *Table 12-1. DAC I/O description* show the block diagram of DAC and the pin description of DAC, respectively.

Figure 12-1. DAC block diagram

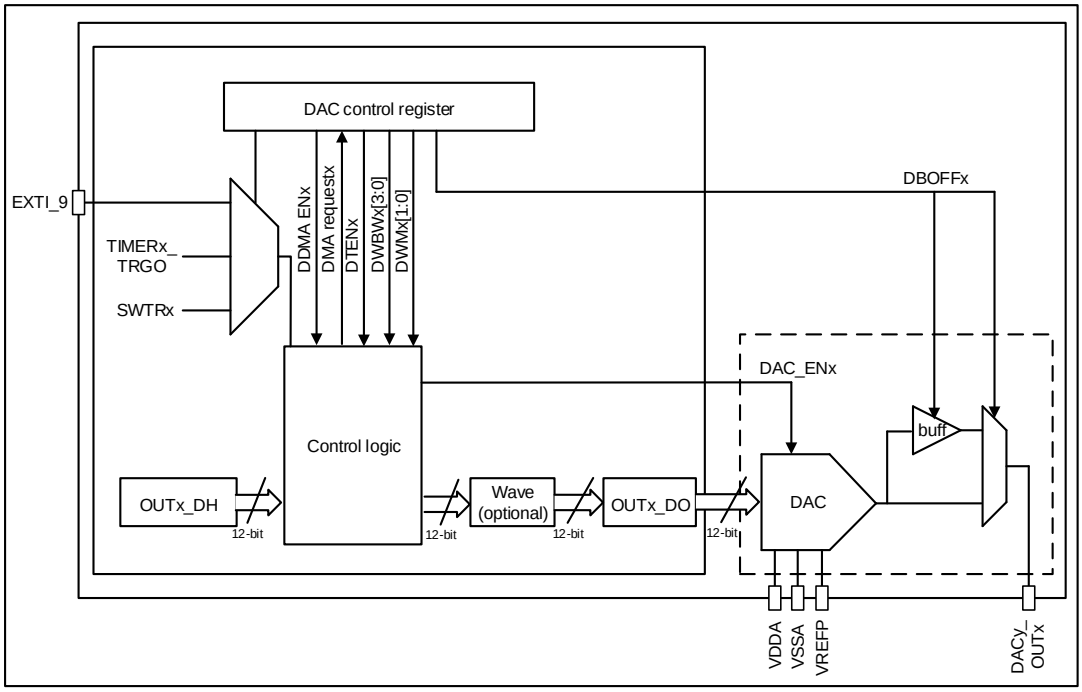

Table 12-1. DAC I/O description

Name	Description	Signal type
V_{DDA}	Analog power supply	Input, analog supply
V_{SSA}	Ground for analog power supply	Input, analog supply ground
V_{REFP}	Positive reference voltage of DAC	Input, analog positive reference
DACy_OUTx	DAC analog output	Analog output signal

The below table details the triggers and outputs of the DAC.

Table 12-2. DAC triggers and outputs summary

	DAC0	
Channel	**Channel0**	**Channel1**
DAC outputs connected to I / Os	PA4	PA5
DAC output buffer	•	•
DAC software trigger	•	
DAC trigger signals from EXTI	EXTI_9	
DAC trigger signals from TIMER	TIMER1_TRGO TIMER2_TRGO TIMER3_TRGO TIMER4_TRGO TIMER5_TRGO TIMER6_TRGO	

Note: The GPIO pins should be configured to analog mode before enable the DAC module.

12.3. Function overview

12.3.1. DAC enable

The DAC can be turned on by setting the DENx bit in the DAC_CTL0 register. A t_{WAKEUP} time is needed to startup the analog DAC submodule.

12.3.2. DAC output buffer

For reducing output impedance and driving external loads without an external operational amplifier, an output buffer is integrated inside each DAC module.

The output buffer, which is turned on by default to reduce the output impedance and improve the driving capability, can be turned off by setting the DBOFFx bit in the DAC_CTL0 register.

12.3.3. DAC data configuration

The 12-bit DAC holding data (OUTx_DH) can be configured by writing any one of the DAC_OUTx_R12DH, DAC_OUTx_L12DH and DAC_OUTx_R8DH registers. When the data is loaded by DAC_OUTx_R8DH register, only the MSB 8 bits are configurable, the LSB 4 bits are forced to 4'b0000.

12.3.4. DAC trigger

The DAC conversion can be triggered by software or rising edge of external trigger source. The DAC external trigger is enabled by setting the DTENx bits in the DAC_CTL0 register. The DAC external triggers are selected by the DTSELx bits in the DAC_CTL0 register, which is shown as ***Table 12-3. Triggers of DAC***.

Table 12-3. Triggers of DAC

DTSELx[2:0]	Trigger Source	Trigger Type
3b'000	TIMER5_TRGO	Hardware trigger
3b'001	TIMER2_TRGO	
3b'010	TIMER6_TRGO	
3b'011	TIMER4_TRGO	
3b'100	TIMER1_TRGO	
3b'101	TIMER3_TRGO	
3b'110	EXTI_9	
3b'111	SWTR	Software trigger

The TIMERx_TRGO signals are generated from the timers, while the software trigger can be generated by setting the SWTRx bits in the DAC_SWT register.

12.3.5. DAC conversion

If the external trigger is enabled by setting the DTENx bit in DAC_CTL0 register, the DAC holding data is transferred to the DAC output data (DAC_OUTx_DO) register when the selected trigger event happened. When the external trigger is disabled, the transfer is performed automatically.

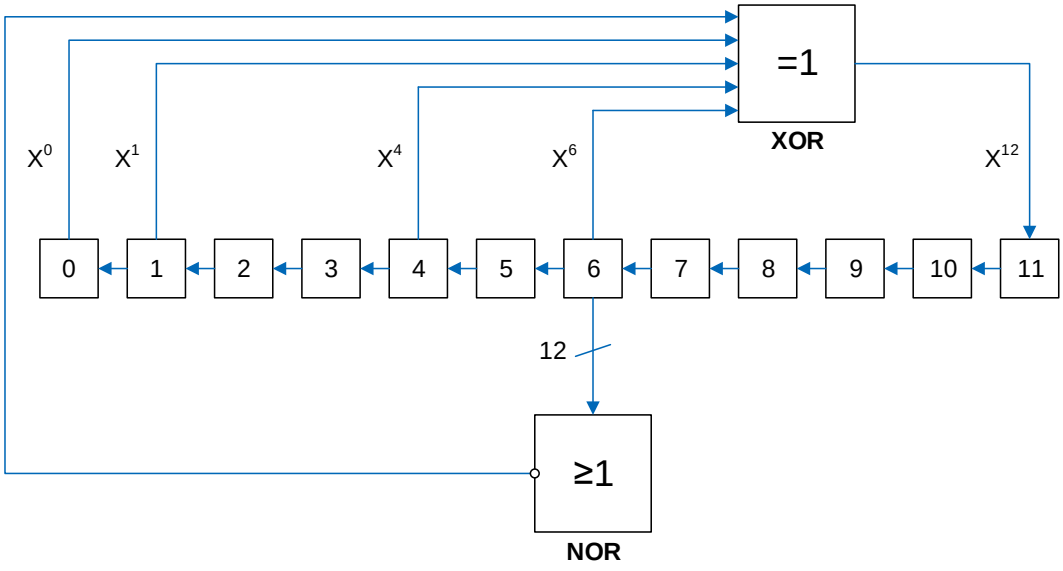
When the DAC holding data (OUTx_DH) is loaded into the DAC_OUTx_DO register, after the time $t_{SETTLING}$ which is determined by the analog output load and the power supply voltage, the analog output is valid.

12.3.6. DAC noise wave

There are two methods of adding noise wave to the DAC output data: LFSR noise wave mode and Triangle wave mode. The noise wave mode can be selected by the DWMx bits in the DAC_CTL0 register. The amplitude of the noise can be configured by the DAC noise wave bit width (DWBWx) bits in the DAC_CTL0 register.

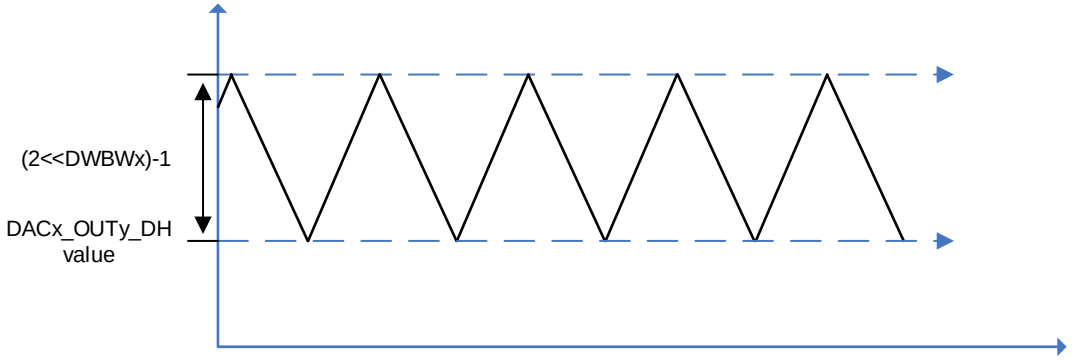
LFSR noise wave mode: there is a Linear Feedback Shift Register (LFSR) in the DAC control logic, it controls the LFSR noise signal which is added to the OUTx_DH value, and then the result is stored into the DAC_OUTx_DO register When the configured DAC noise wave bit width is less than 12, the noise signal equals to the LSB DWBWx bits of the LFSR register, while the MSB bits are masked.

Figure 12-2. DAC LFSR algorithm



Triangle noise mode: a triangle signal is added to the OUTx_DH value, and then the result is stored into the DAC_OUTx_DO register. The minimum value of the triangle signal is 0, while the maximum value of the triangle signal is (2 << DWBWx) - 1.

Figure 12-3. DAC triangle noise wave



12.3.7. DAC output voltage

The following equation determines the analog output voltage on the DAC pin.

$$V_{DAC\_OUT}=V_{REFP}*OUTx\_DO/4096 \quad (12\text{-}1)$$

The digital input is linearly converted to an analog output voltage and its range is 0 to V_{REFP}.

12.3.8. DMA request

When the external trigger is enabled, the DMA request is enabled by setting the DDMAENx bit of the DAC_CTL0 register. A DMA request will be generated when an external hardware trigger (not a software trigger) occurs.

12.3.9. DAC concurrent conversion

When the two output channels work at the same time, for maximum bus bandwidth utilization in specific applications, two output channels can be configured in concurrent mode. In concurrent mode, the OUTx_DH and OUTx_DO value will be updated at the same time.

There are three concurrent registers that can be used to load the OUTx_DH value: DACC_R8DH, DACC_R12DH and DACC_L12DH. User just need to access a unique register to realize driving two DAC channels at the same time.

When external trigger is enabled, please ensure both DTENx bits be set, DTSEL0/DTSEL1 bits be same to guarantee the simultaneous trigger.

When DMA is enabled, please ensure any DDMAENx bit in one DAC be set.

The noise mode and noise bit width can be configured either the same or different, depending on the application scenario.

12.4. Register definition

DAC0 base address: 0x4000 7400

12.4.1. DACx control register 0 (DAC_CTL0)

Address offset: 0x00

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit).

13. Watchdog timer (WDGT)

The watchdog timer (WDGT) is a hardware timing circuitry that can be used to detect system failures due to software malfunctions. There are two watchdog timer peripherals in the chip: free watchdog timer (FWDGT) and window watchdog timer (WWDGT). They offer a combination of a high safety level, flexibility of use and timing accuracy. Both watchdog timers are offered to resolve malfunctions of software.

The watchdog timer will generate a reset when the internal counter reaches a given value. The watchdog timer counter can be stopped while the processor is in the debug mode.

13.1. Free watchdog timer (FWDGT)

13.1.1. Overview

The free watchdog timer (FWDGT) has free clock source (IRC40K). Thereupon the FWDGT can operate even if the main clock fails. It's suitable for the situation that requires an independent environment and lower timing accuracy.

The free watchdog timer causes a reset when the internal down counter reaches 0. The register write protection function in free watchdog can be enabled to prevent it from changing the configuration unexpectedly.

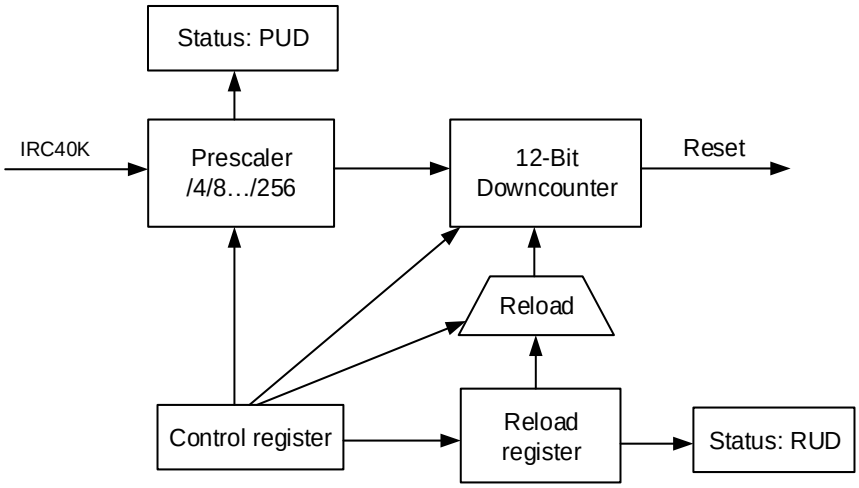
13.1.2. Characteristics

- Free-running 12-bit downcounter.
- Reset when the downcounter reaches 0, if the watchdog is enabled.
- Free clock source, FWDGT can operate even if the main clock fails such as in standby and Deep-sleep modes.
- Hardware free watchdog bit, automatically start the FWDGT at power on.
- FWDGT debug mode, the FWDGT can stop or continue to work in debug mode.

13.1.3. Function overview

The free watchdog consists of an 8-stage prescaler and a 12-bit down-counter.***Figure 13-1. Free watchdog block diagram*** shows the functional block of the free watchdog module.

Figure 13-1. Free watchdog block diagram



The free watchdog is enabled by writing the value 0xCCCC in the control register (FWDGT_CTL), and the counter starts counting down. When the counter reaches the value 0x000, a reset is generated.

The counter can be reloaded by writing the value 0xAAAA to the FWDGT_CTL register at anytime. The reload value comes from the FWDGT_RLD register. The software can prevent the watchdog reset by reloading the counter before the counter reaches the value 0x000.

The free watchdog can automatically start at power on when the hardware free watchdog bit in the device option bytes is set. To avoid reset, the software should reload the counter before the counter reaches 0x000.

The FWDGT_PSC register and the FWDGT_RLD register are write-protected. Before writing these registers, the software should write the value 0x5555 to the FWDGT_CTL register. These registers will be protected again by writing any other value to the FWDGT_CTL register. When an update operation of the prescaler register (FWDGT_PSC) or the reload value register (FWDGT_RLD) is on going, the status bits in the FWDGT_STAT register are set.

If the FWDGT_HOLD bit in DBG module is cleared, the FWDGT continues to work even the RISC-V core halted (Debug mode). While the FWDGT stops in Debug mode if the FWDGT_HOLD bit is set.

Table 13-1. Min/max FWDGT timeout period at 40 kHz (IRC40K)

Prescaler divider	PSC[2:0] bits	Min timeout (ms) RLD[11:0]=0x000	Max timeout (ms) RLD[11:0]=0xFFF
1 / 4	000	0.025	409.525
1 / 8	001	0.025	819.025
1 / 16	010	0.025	1638.025
1 / 32	011	0.025	3276.025
1 / 64	100	0.025	6552.025
1 / 128	101	0.025	13104.025

Prescaler divider	PSC[2:0] bits	Min timeout (ms) RLD[11:0]=0x000	Max timeout (ms) RLD[11:0]=0xFFF
1 / 256	110 or 111	0.025	26208.025

The FWDGT timeout can be more accurate by calibrating the IRC40K.

Note：

- For all the GD32VF103 devices, when after the execution of dog reload operation, if the MCU needs enter the deepsleep/standby mode immediately, (more than 3) IRC40K clock interval must be inserted in the middle of reload and deepsleep/standby mode commands by software setting.
- For all the GD32VF103 devices, when software finished the executing operation of FWDGT, if the MCU needs enter the deepsleep/standby mode immediately, it is at least 100 us interval left between the two instructions.
- For all the GD32VF103 devices, if you need access to the MCU debug mode, recommend to use hardware watchdog, or enable watchdog again after exit debug mode by software setting.

13.1.4. Register definition

FWDGT base address: 0x4000 3000

Control register (FWDGT_CTL)

Address offset: 0x00
Reset value: 0x0000 0000

This register can be accessed by half-word(16-bit) or word(32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMD[15:0]															
w															

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	CMD[15:0]	Write only. Several different fuctions are realized by writing these bits with different values: 0x5555: Disable the FWDGT_PSC and FWDGT_RLD write protection. 0xCCCC: Start the free watchdog counter. When the counter reduces to 0, the free watchdog generates a reset. 0xAAAA: Reload the counter.

Prescaler register (FWDGT_PSC)

Address offset: 0x04
Reset value: 0x0000 0000

This register can be accessed by half-word(16-bit) or word(32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														PSC[2:0]	
														rw	

Bits	Fields	Descriptions
31:3	Reserved	Must be kept at reset value.
2:0	PSC[2:0]	Free watchdog timer prescaler selection. Write 0x5555 in the FWDGT_CTL register before writing these bits. During a write operation to this register, the PUD bit in the FWDGT_STAT register is set and the value read from this register is invalid. 000: 1 / 4 001: 1 / 8

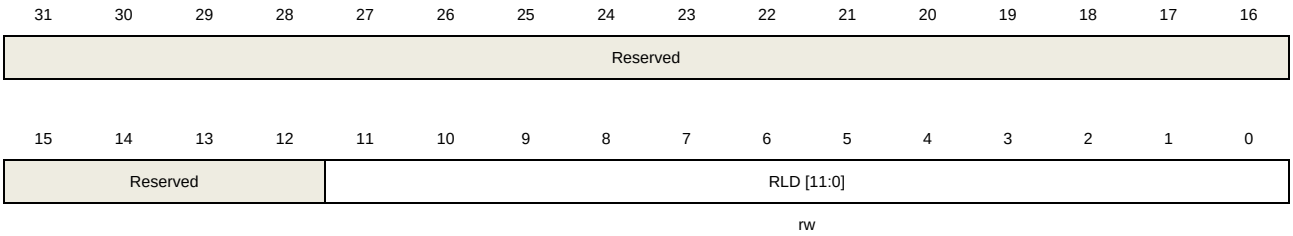
010: 1 / 16
011: 1 / 32
100: 1 / 64
101: 1 / 128
110: 1 / 256
111: 1 / 256

If several prescaler values are used by the application, it is mandatory to wait until PUD bit has been reset before changing the prescaler value. If the prescaler value has been updated, it is not necessary to wait until PUD has been reset before continuing code execution (Before entering low-power mode, it is necessary to wait until PUD is reset).

Reload register (FWDGT_RLD)

Address offset: 0x08
Reset value: 0x0000 0FFF

This register can be accessed by half-word(16-bit) or word(32-bit).



Bits	Fields	Descriptions
31:12	Reserved	Must be kept at reset value.
11:0	RLD[11:0]	Free watchdog timer counter reload value. Write 0xAAAA in the FWDGT_CTL register will reload the FWDGT counter with the RLD value. These bits are write-protected. Write 0x5555 in the FWDGT_CTL register before writing these bits. During a write operation to this register, the RUD bit in the FWDGT_STAT register is set and the value read from this register is invalid. If several reload values are used by the application, it is mandatory to wait until RUD bit has been reset before changing the reload value. If the reload value has been updated, it is not necessary to wait until RUD has been reset before continuing code execution (Before entering low-power mode, it is necessary to wait until RUD is reset).

Status register (FWDGT_STAT)

Address offset: 0x0C
Reset value: 0x0000 0000

This register can be accessed by half-word(16-bit) or word(32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved														RUD	PUD
														r	r

Bits	Fields	Descriptions
31:2	Reserved	Must be kept at reset value.
1	RUD	Free watchdog timer counter reload value update During a write operation to FWDGT_RLD register, this bit is set and the value read from FWDGT_RLD register is invalid. This bit is reset by hardware after the update operation of FWDGT_RLD register.
0	PUD	Free watchdog timer prescaler value update During a write operation to FWDGT_PSC register, this bit is set and the value read from FWDGT_PSC register is invalid. This bit is reset by hardware after the update operation of FWDGT_PSC register.

13.2. Window watchdog timer (WWDGT)

13.2.1. Overview

The window watchdog timer (WWDGT) is used to detect system failures due to software malfunctions. After the window watchdog timer starts, the value of downcounter reduces progressively. The watchdog timer causes a reset when the counter reached 0x3F (the CNT[6] bit becomes cleared). The watchdog timer also causes a reset if the counter is refreshed before the counter reached the window register value. So the software should refresh the counter in a limited window. The window watchdog timer generates an early wakeup status flag when the counter reaches 0x40. Interrupt occurs if it is enabled.

The window watchdog timer clock is prescaled from the APB1 clock. The window watchdog timer is suitable for the situation that requires an accurate timing.

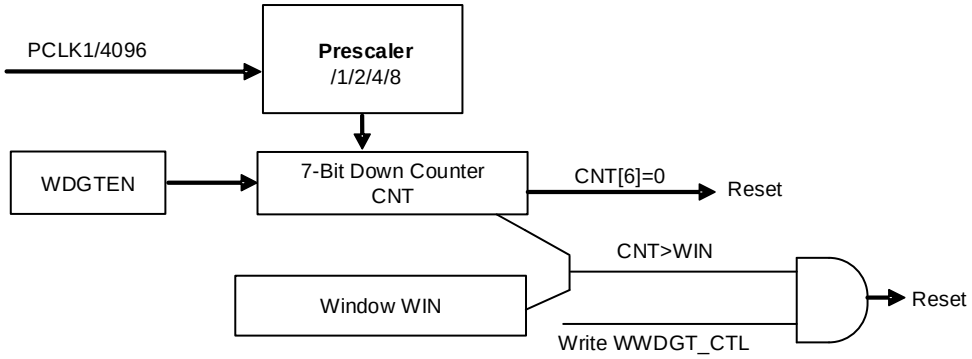
13.2.2. Characteristics

- Programmable free-running 7-bit downcounter.
- Generate reset in two conditions when WWDGT is enabled:
  - Reset when the counter reached 0x3F.
  - The counter is refreshed when the value of the counter is greater than the window register value.
- Early wakeup interrupt (EWI): if the watchdog is started and the interrupt is enabled, the interrupt occurs when the counter reaches 0x40.
- WWDGT debug mode, the WWDGT can stop or continue to work in debug mode.

13.2.3. Function overview

If the window watchdog timer is enabled (set the WDGTEN bit in the WWDGT_CTL), the watchdog timer cause a reset when the counter reaches 0x3F (the CNT[6] bit becomes cleared), or when the counter is refreshed before the counter reaches the window register value.

Figure 13-2. Window watchdog timer block diagram



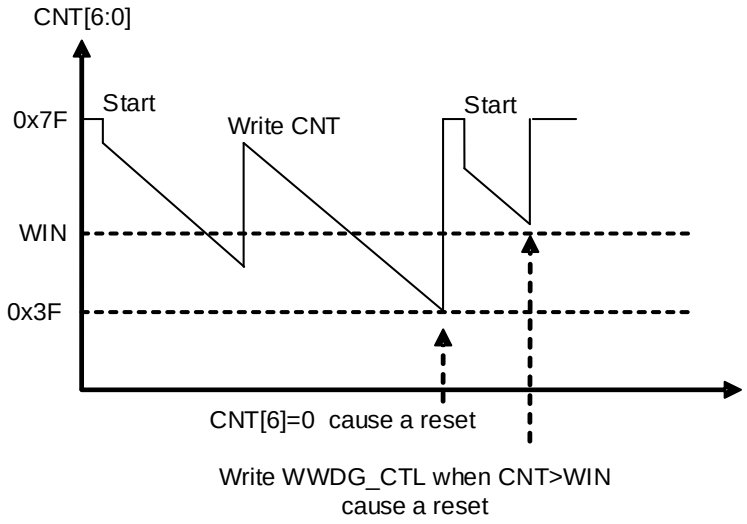
The window watchdog timer is always disabled after power on reset. The software starts the watchdog by setting the WDGTEN bit in the WWDGT_CTL register. Whenever window watchdog timer is enabled, the counter counts down all the time, the configured value of the counter should be greater than 0x3F, it implies that the CNT[6] bit should be set. The CNT[5:0] determine the maximum time interval of two reloading. The countdown speed depends on the APB1 clock and the prescaler (PSC[1:0] bits in the WWDGT_CFG register).

The WIN[6:0] bits in the configuration register (WWDGT_CFG) specifies the window value. The software can prevent the reset event by reloading the downcounter when counter value is less than the window value and greater than 0x3F, otherwise the watchdog causes a reset.

The early wakeup interrupt (EWI) is enabled by setting the EWIE bit in the WWDGT_CFG register, and the interrupt is generated when the counter reaches 0x40. The software can do something such as communication or data logging in the interrupt service routine (ISR) in order to analyse the reason of software malfunctions or save the important data before resetting the device. Moreover the software can reload the counter in ISR to manage a software system check and so on. In this case, the WWDGT will never generate a WWDGT reset but can be used for other things.

The EWI interrupt is cleared by writing '0' to the EWIF bit in the WWDGT_STAT register.

Figure 13-3. Window watchdog timing diagram



Calculate the WWDGT timeout by using the formula below.

$$t_{WWDGT}=t_{PCLK1} \times 4096 \times 2^{PSC} \times (CNT[5:0]+1) \quad (ms) \qquad (13\text{-}1)$$

where:

t_{WWDGT}: WWDGT timeout

t_{PCLK1}: APB1 clock period measured in ms

Refer to the table below for the minimum and maximum values of the t_{WWDGT}.

Table 13-2. Min/max timeout value at 54 MHz (f_{PCLK1})

Prescaler divider	PSC[1:0]	Min timeout value CNT[6:0] =0x40	Max timeout value CNT[6:0]=0x7F
1 / 1	00	75.8 µs	4.85ms
1 / 2	01	151.7 µs	9.7 ms
1 / 4	10	303.4 µs	19.4 ms
1 / 8	11	606.8 µs	38.8 ms

If the WWDGT_HOLD bit in DBG module is cleared, the WWDGT continues to work even the RISC-V core halted (Debug mode). While the WWDGT_HOLD bit is set, the WWDGT stops in Debug mode.

13.2.4. Register definition

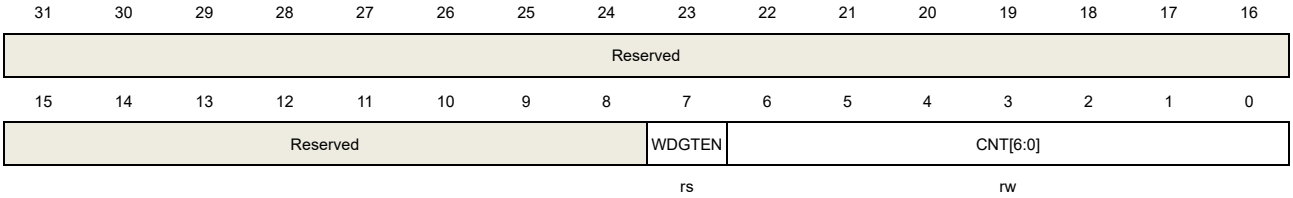
WWDGT base address: 0x4000 2C00

Control register (WWDGT_CTL)

Address offset: 0x00

Reset value: 0x0000 007F

This register can be accessed by half-word (16-bit) or word (32-bit).



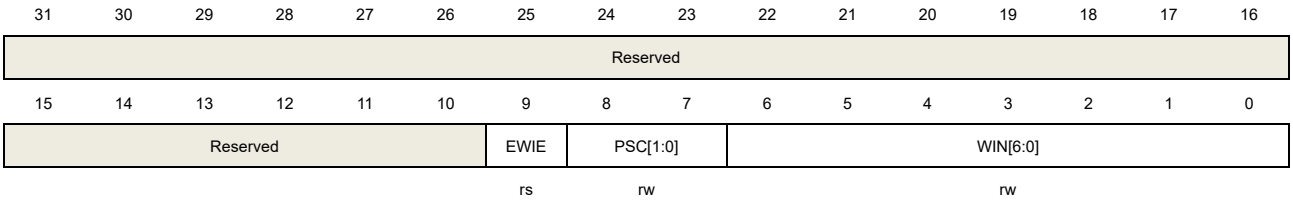
Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value.
7	WDGTEN	Start the window watchdog timer. Only can cleared by a hardware reset. Writing 0 has no effect. 0: Window watchdog timer disabled 1: Window watchdog timer enabled
6:0	CNT[6:0]	The value of the watchdog timer counter. A reset occurs when the value of this counter decreases from 0x40 to 0x3F. When the value of this counter is greater than the window value, writing this counter also causes a reset.

Configuration register (WWDGT_CFG)

Address offset: 0x04

Reset value: 0x0000 007F

This register can be accessed by half-word (16-bit) or word (32-bit).



Bits	Fields	Descriptions
31:10	Reserved	Must be kept at reset value.
9	EWIE	Early wakeup interrupt enable. If the bit is set, an interrupt occurs when the counter reaches 0x40. It can be cleared by a hardware reset or software reset by setting the WWDGTRST bit of the RCU module. A write operation of 0 has no effect.

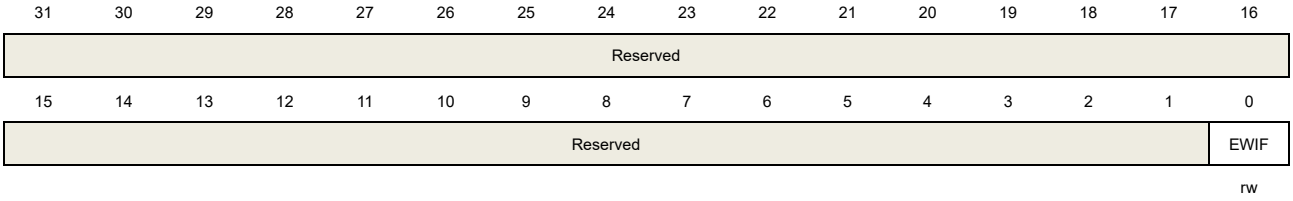
8:7	PSC[1:0]	Prescaler. The time base of the watchdog timer counter 00: (PCLK1 / 4096) / 1 01: (PCLK1 / 4096) / 2 10: (PCLK1 / 4096) / 4 11: (PCLK1 / 4096) / 8
6:0	WIN[6:0]	The Window value. A reset occurs if the watchdog counter (CNT bits in WWDGT_CTL) is written when the value of the watchdog counter is greater than the Window value.

Status register (WWDGT_STAT)

Address offset: 0x08

Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit).



Bits	Fields	Descriptions
31:1	Reserved	Must be kept at reset value.
0	EWIF	Early wakeup interrupt flag. When the counter reaches 0x40, this bit is set by hardware even the interrupt is not enabled (EWIE in WWDGT_CFG is cleared). This bit is cleared by writing 0 to it. There is no effect when writing 1 to it.

14. Real-time Clock (RTC)

14.1. Overview

The RTC is usually used as a clock-calendar. The RTC circuits are located in two power supply domains. The ones in the Backup Domain consist of a 32-bit up-counter, an alarm, a prescaler, a divider and the RTC clock configuration register. That means the RTC settings and time are kept when the device resets or wakes up from Standby mode. While the circuits in the VDD domain only include the APB interface and a control register. In the following sections, the details of the RTC function will be described.

14.2. Characteristics

- 32-bit programmable counter for counting elapsed time
  Programmable prescaler: Max division factor is up to 2^{20}
- Separate clock domains:
  - PCLK1 clock domain
  - RTC clock domain (this clock must be at least 4 times slower than the PCLK1 clock)
- RTC clock source:
  - HXTAL clock divided by 128
  - LXTAL oscillator clock
  - IRC40K oscillator clock
- Maskable interrupt source:
  - Alarm interrupt
  - Second interrupt
  - Overflow interrupt

14.3. Function overview

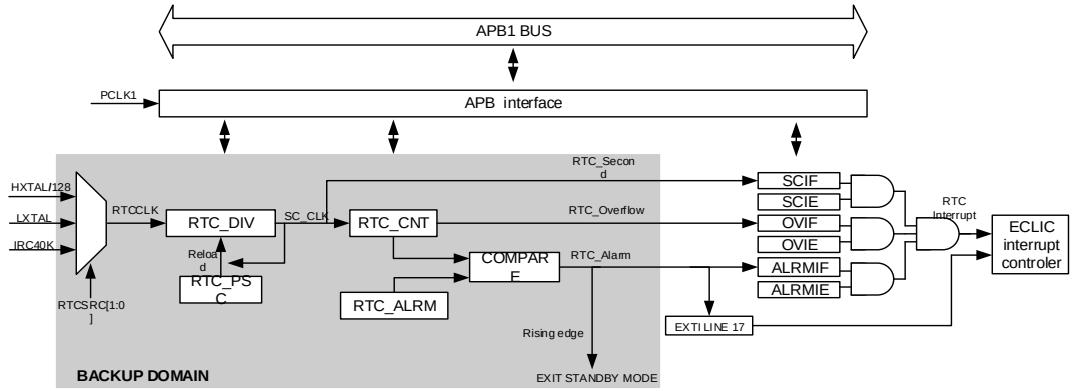
The RTC circuits consist of two major units: APB interface located in PCLK1 clock domain and RTC core located in RTC clock domain.

APB Interface is connected with the APB1 bus. It includes a set of registers, can be accessed by APB1 bus.

RTC core includes two major blocks. One is the RTC prescaler block, which generates the RTC time base clock SC_CLK. RTC prescaler block includes a 20-bit programmable divider (RTC prescaler) which can make SC_CLK is divided from RTC source clock. If second interrupt is enabled in the RTC_INTEN register, the RTC will generate an interrupt at every SC_CLK rising edge. Another block is a 32-bit programmable counter, which can be initialized with the value of current system time. If alarm interrupt is enabled in the RTC_INTEN register, the RTC will generate an alarm interrupt when the system time equals to the alarm time

(stored in the RTC_ALRMH/L register),

Figure 14-1. Block diagram of RTC



14.3.1. RTC reset

The APB interface and the RTC_INTEN register are reset by system reset. The RTC core (prescaler, divider, counter and alarm) is reset only by a backup domain reset.

Steps to enable access to the backup registers and the RTC after reset are as follows:

1. Set the PMUEN and BKPIEN bits in the RCU_APB1EN register to enable the power and backup interface clocks.

2. Enable access to the backup registers and RTC by setting the BKPWEN bit in the (PMU_CTL).

14.3.2. RTC reading

The APB interface and RTC core are located in two different power supply domains.

In the RTC core, only counter and divider registers are readable registers. And the values in the two registers and the RTC flags are internally updated at each rising edge of the RTC clock, which is resynchronized by the APB1 clock.

When the APB interface is immediately enabled from a disable state, the read operation is not recommended because the first internal update of the registers has not finished. That means, when a system reset, power reset, waking up from Standby mode or Deep-sleep mode occurs, the APB interface was in disabled state, but the RTC core has been kept running. In these cases, the correct read operation should first clear the RSYNF bit in the RTC _CTL register and wait for it to be set by hardware. While WFI and WFE have no effects on the RTC APB interface.

14.3.3. RTC configuration

The RTC_PSC, RTC_CNT and RTC_ALRM registers in the RTC core are writable. These registers' value can be set only when the peripheral enter configuration mode. And the CMF

bit in the RTC_CTL register is used to indicate the configuration mode status. The write operation executes when the peripheral exit configuration mode, and it takes at least three RTCCLK cycles to complete. The value of the LWOFF bit in the RTC_CTL register sets to '1', if the write operation finished. The new write operation should wait for the previous one finished.

The configuration steps are as follows:

a) Wait until the value of LWOFF bit in the RTC_CTL register sets to '1';
b) Enter Configuration mode by setting the CMF bit in the RTC_CTL register;
c) Write to the RTC registers;
d) Exit Configuration mode by clearing the CMF bit in the RTC_CTL register;
e) Wait until the value of LWOFF bit in the RTC_CTL register sets to '1'.

14.3.4. RTC flag assertion

Before the update of the RTC Counter, the RTC second interrupt flag (SCIF) is asserted on the last RTCCLK cycle.

Before the counter equal to the RTC Alarm value which stored in the Alarm register increases by one, the RTC Alarm interrupt flag (ALRMIF) is asserted on the last RTCCLK cycle.

Before the counter equals to 0x0, the RTC Overflow interrupt flag (OVIF) is asserted on the last RTCCLK cycle.

The RTC Alarm write operation and Second interrupt flag must be synchronized by using either of the following sequences:

- Use the RTC alarm interrupt and update the RTC Alarm and/or RTC Counter registers inside the RTC interrupt routine;
- Update the RTC Alarm and/or the RTC Counter registers after the SCIF bit to be set in the RTC Control register.

Figure 14-2. RTC second and alarm waveform example (RTC_PSC = 3, RTC_ALRM = 2)

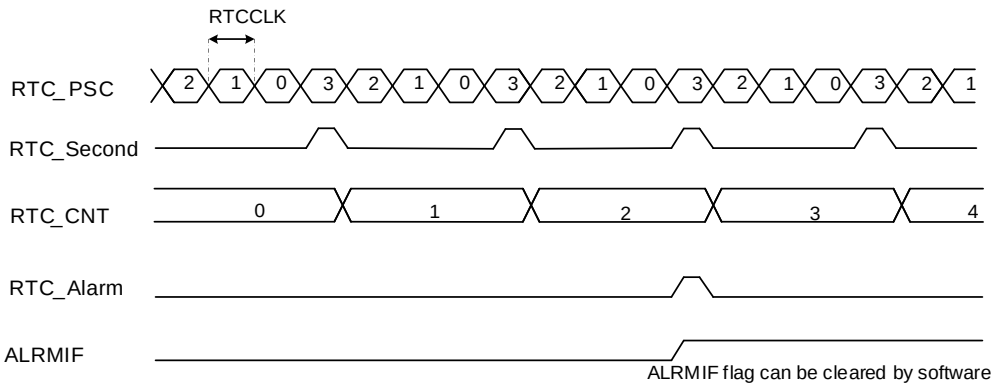


Figure 14-3. RTC second and overflow waveform example (RTC_PSC= 3)

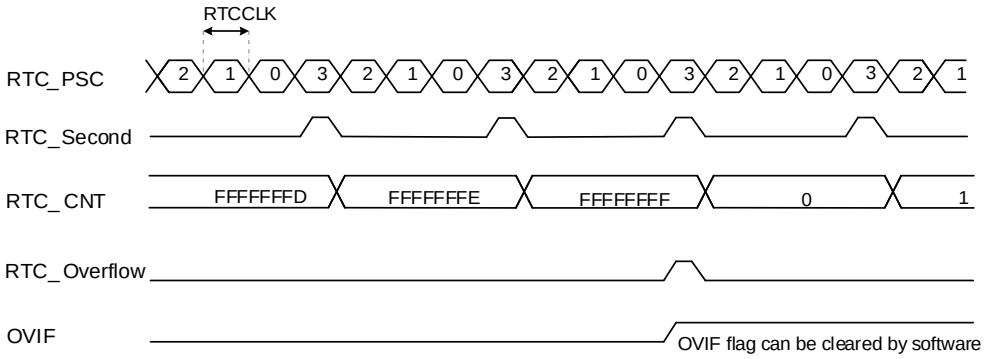


14.4. Register definition

RTC base address: 0x4000 2800

14.4.1. RTC interrupt enable register(RTC_INTEN)

Address offset: 0x00

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved													OVIE	ALRMIE	SCIE
													rw	rw	rw

Bits	Fields	Descriptions
31:3	Reserved	Must be kept at reset value.
2	OVIE	Overflow interrupt enable 0: Disable overflow interrupt 1: Enable overflow interrupt
1	ALRMIE	Alarm interrupt enable 0: Disable alarm interrupt 1: Enable alarm interrupt
0	SCIE	Second interrupt enable 0: Disable second interrupt 1: Enable second interrupt

14.4.2. RTC control register(RTC_CTL)

Address offset: 0x04

Reset value: 0x0020

This register can be accessed by half-word (16-bit) or word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved										LWOFF	CMF	RSYNF	OVIF	ALRMIF	SCIF
										r	rw	rc_w0	rc_w0	rc_w0	rc_w0

Bits	Fields	Descriptions

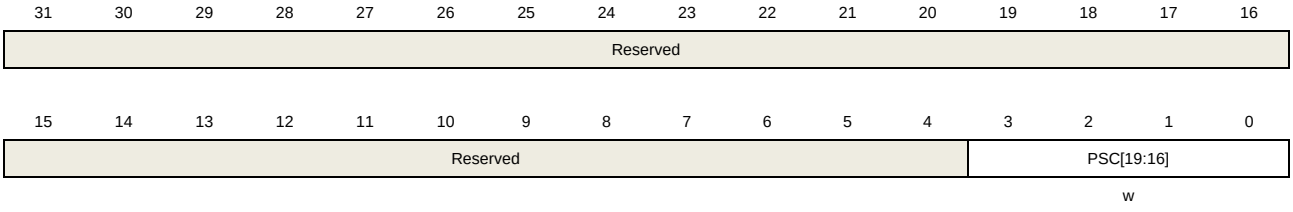
31:6	Reserved	Must be kept at reset value
5	LWOFF	Last write operation finished flag 0: Last write operation on RTC registers did not finished. 1: Last write operation on RTC registers finished.
4	CMF	Configuration mode flag 0: Exit configuration mode. 1: Enter configuration mode.
3	RSYNF	Registers synchronized flag 0: Registers not yet synchronized with the APB1 clock. 1: Registers synchronized with the APB1 clock.
2	OVIF	Overflow interrupt flag 0: Overflow event not detected 1: Overflow event detected. An interrupt will occur if the OVIE bit is set in RTC_INTEN.
1	ALRMIF	Alarm interrupt flag 0: Alarm event not detected 1: Alarm event detected. An interrupt named RTC global interrupt will occur if the ALRMIE bit is set in RTC_INTEN. And another interrupt named the RTC Alarm interrupt will occur if the EXTI 17 is enabled in interrupt mode.
0	SCIF	Second interrupt flag 0: Second event not detected. 1: Second event detected. An interrupt will occur if the SCIE bit is set in RTC_INTEN. Set by hardware when the divider reloads the value in RTC_PSCH/L, thus incrementing the RTC counter.

14.4.3. RTC prescaler high register (RTC_PSCH)

Address offset: 0x08

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)



Bits	Fields	Descriptions

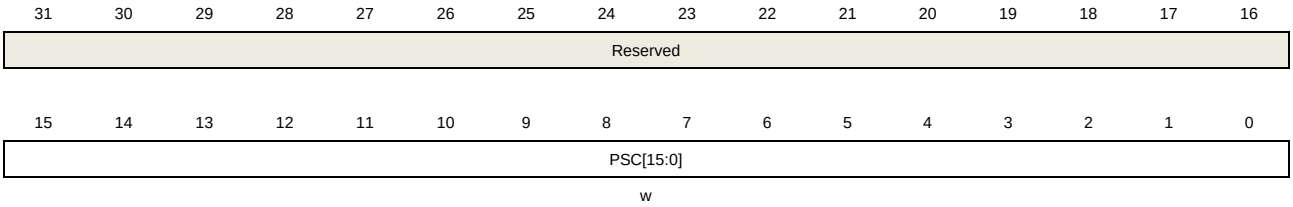
31:4	Reserved	Must be kept at reset value
3:0	PSC[19:16]	RTC prescaler value high

14.4.4. RTC prescaler low register (RTC_PSCL)

Address offset: 0x0C

Reset value: 0x8000

This register can be accessed by half-word (16-bit) or word (32-bit)



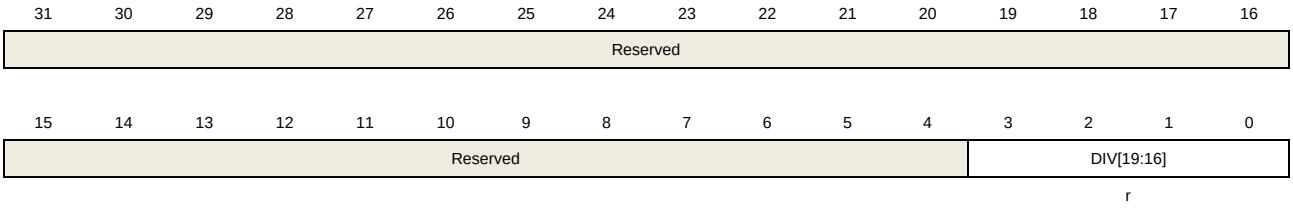
Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15:0	PSC[15:0]	RTC prescaler value low The frequency of SC_CLK is the RTCCLK frequency divided by (PSC[19:0]+1).

14.4.5. RTC divider high register (RTC_DIVH)

Address offset: 0x10

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)



Bits	Fields	Descriptions
31:4	Reserved	Must be kept at reset value
3:0	DIV[19:16]	RTC divider value high

14.4.6. RTC divider low register (RTC_DIVL)

Address offset: 0x14

Reset value: 0x8000

This register can be accessed by half-word (16-bit) or word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(3) Only update events will generate DMA request. Note that TIMER5/6 do not have DMA configuration registers.

(4) The source of TIMER1 ITI1 is decided by TIMER1ITI1_REMAP in ***AFIO port configuration register 0 (AFIO_PCF0)***;

15.1. Advanced timer (TIMERx, x=0)

15.1.1. Overview

The advanced timer module (TIMER0) is a four-channel timer that supports both input capture and output compare. They can generate PWM signals to control motor or be used for power management applications. The advanced timer has a 16-bit counter that can be used as an unsigned counter.

In addition, the advanced timers can be programmed and be used for counting, their external events can be used to drive other timers.

Timer also includes a dead-time insertion module which is suitable for motor control applications.

Timers are completely independent with each other, but they may be synchronized to provide a larger timer with their counter value incrementing in unison.

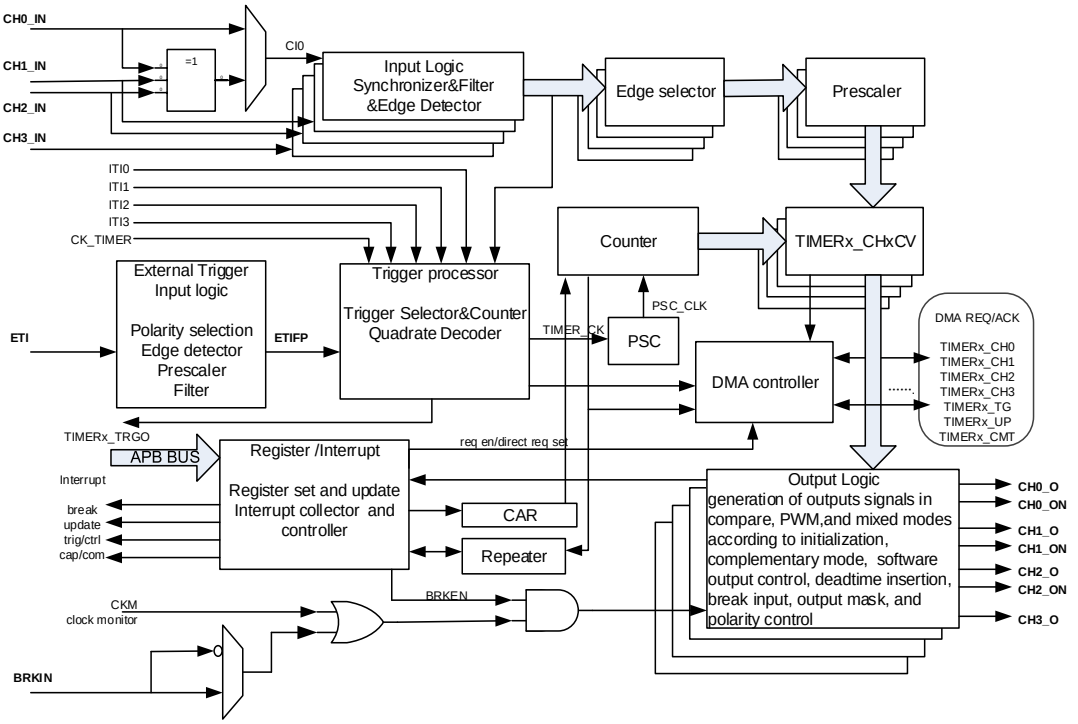
15.1.2. Characteristics

- Total channel num: 4.
- Counter width: 16-bit.
- Clock source of timer is selectable: internal clock, internal trigger, external input, external trigger.
- Multiple counter modes: up counting, down counting and center-aligned counting.
- Quadrature decoder: used for motion tracking and determination of both rotation direction and position.
- Hall sensor function: used for 3-phase motor control.
- Programmable prescaler: 16-bit. The factor can be changed ongoing.
- Each channel is user-configurable: input capture mode, output compare mode, programmable PWM mode and single pulse mode
- Programmable dead time insertion.
- Auto reload function.
- Programmable counter repetition function.
- Break input.
- Interrupt output or DMA request: update event, trigger event, compare/capture event and break input.
- Daisy chaining of timer module allows a single timer to start multiple timers.
- Timer synchronization allows the selected timers to start counting on the same clock cycle.
- Timer master-slave management.

15.1.3. Block diagram

Figure 15-1. Advanced timer block diagram provides details of the internal configuration of the advanced timer.

Figure 15-1. Advanced timer block diagram



15.1.4. Function overview

Clock source configuration

The clock source of the advanced timer can be either the CK_TIMER or an alternate clock source controlled by SMC bits (TIMERx_SMCFG bit[2:0]).

- SMC [2:0] == 3'b000. Internal clock CK_TIMER is selected as timer clock source which is from module RCU.

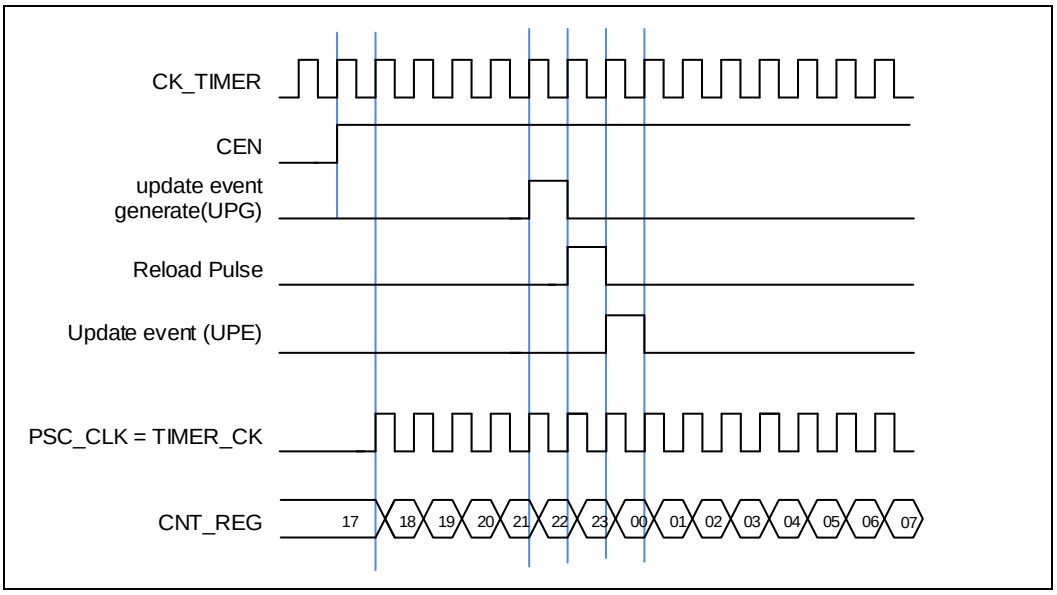
The default clock source is the CK_TIMER for driving the counter prescaler when the SMC [2:0] == 3'b000. When the CEN is set, the CK_TIMER will be divided by PSC value to generate PSC_CLK.

In this mode, the TIMER_CK which drives counter's prescaler to count is equal to CK_TIMER which is from RCU module.

If the SMC [2:0] in the TIMERx_SMCFG register are setting to an available value including 0x1, 0x2, 0x3 and 0x7, the prescaler is clocked by other clock sources selected by the TRGS [2:0] in the TIMERx_SMCFG register, more details will be introduced later. When the SMC

[2:0] bits are set to 0x4, 0x5 or 0x6, the Internal clock CK_TIMER is the counter prescaler driving clock source.

Figure 15-2. Timing chart of internal clock divided by 1



- SMC [2:0] == 3'b111 (external clock mode 0). External input pin is selected as timer clock source

The TIMER_CK, which drives counter's prescaler to count, can be triggered by the event of rising or falling edge on the external pin TIMERx_CH0/TIMERx_CH1. This mode can be selected by setting SMC [2:0] to 0x7 and the TRGS [2:0] to 0x4, 0x5 or 0x6.

And, the counter prescaler can also be driven by rising edge on the internal trigger input pin ITI0/1/2/3. This mode can be selected by setting SMC [2:0] to 0x7 and the TRGS [2:0] to 0x0, 0x1, 0x2 or 0x3.

- SMC1== 1'b1 (external clock mode 1). External input ETI is selected as timer clock source

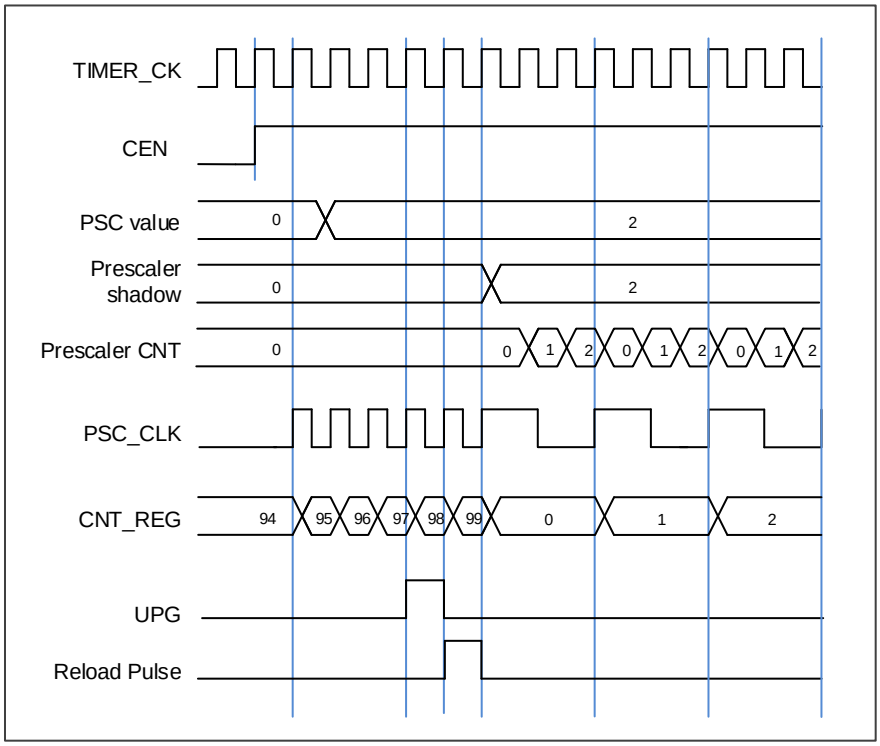
The TIMER_CK, which drives counter's prescaler to count, can be triggered by the event of rising or falling edge on the external pin ETI. This mode can be selected by setting the SMC1 bit in the TIMERx_SMCFG register to 1. The other way to select the ETI signal as the clock source is setting the SMC [2:0] to 0x7 and the TRGS [2:0] to 0x7. Note that the ETI signal is derived from the ETI pin sampled by a digital filter. When the ETI signal is selected as the clock source, the trigger controller including the edge detection circuitry will generate a clock pulse on each ETI signal rising edge to clock the counter prescaler.

Clock prescaler

The counter clock (PSC_CK) is obtained by the TIMER_CK through the prescaler, and the prescale factor can be configured from 1 to 65536 through the prescaler register (TIMERx_PSC). The new written prescaler value will not take effect until the next update

event.

Figure 15-3. Timing chart of PSC value change from 0 to 2



Counter up counting

In this mode, the counter counts up continuously from 0 to the counter-reload value, which is defined in the TIMERx_CAR register, in a count-up direction. Once the counter reaches the counter reload value, the counter will start counting up from 0 again and an overflow event will be generated. In addition, the update events will be generated after (TIMERx_CREP+1) times of overflow events. The counting direction bit DIR in the TIMERx_CTL0 register should be set to 0 for the up counting mode.

Whenever, if the update event software trigger is enabled by setting the UPG bit in the TIMERx_SWEVG register, the counter value will be initialized to 0 and an update event will be generated.

If the UPDIS bit in TIMERx_CTL0 register is set, the update event is disabled.

When an update event occurs, all the shadow registers (repetition counter register, counter auto reload register, prescaler register) are updated.

Figure 15-4. Timing chart of up counting mode, PSC=0/2 and *Figure 15-5. Timing chart of up counting mode, change TIMERx_CAR ongoing* show some examples of the counter behavior for different clock prescaler factors when TIMERx_CAR=0x99.

Figure 15-4. Timing chart of up counting mode, PSC=0/2

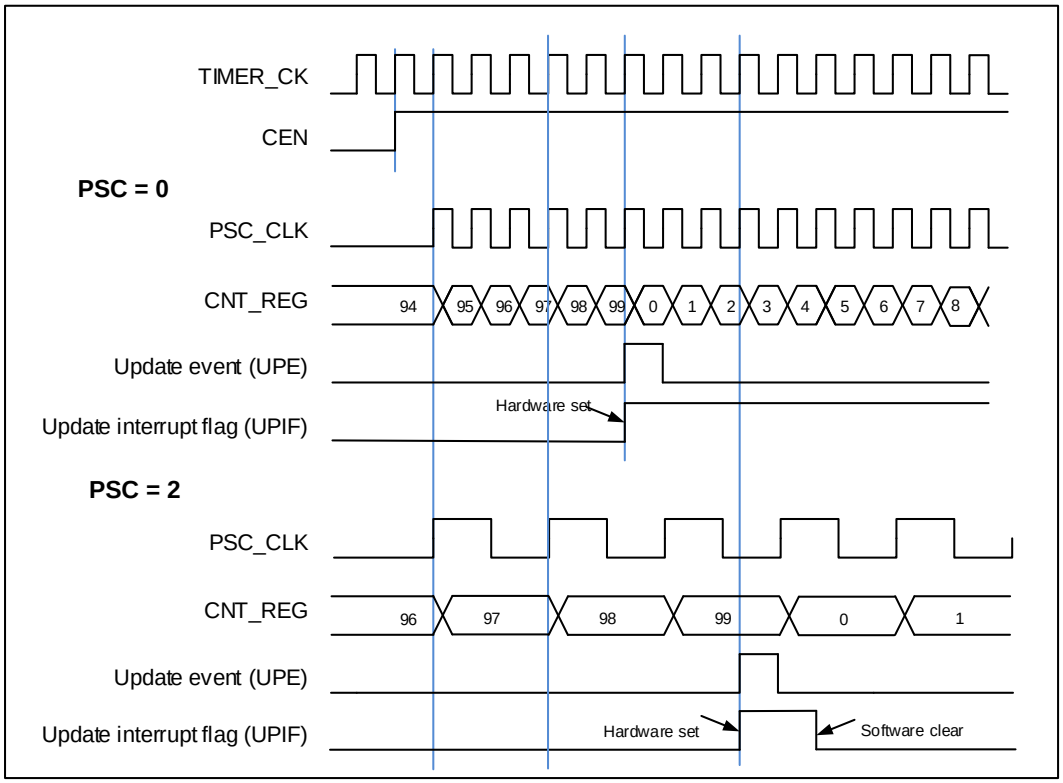


Figure 15-5. Timing chart of up counting mode, change TIMERx_CAR ongoing

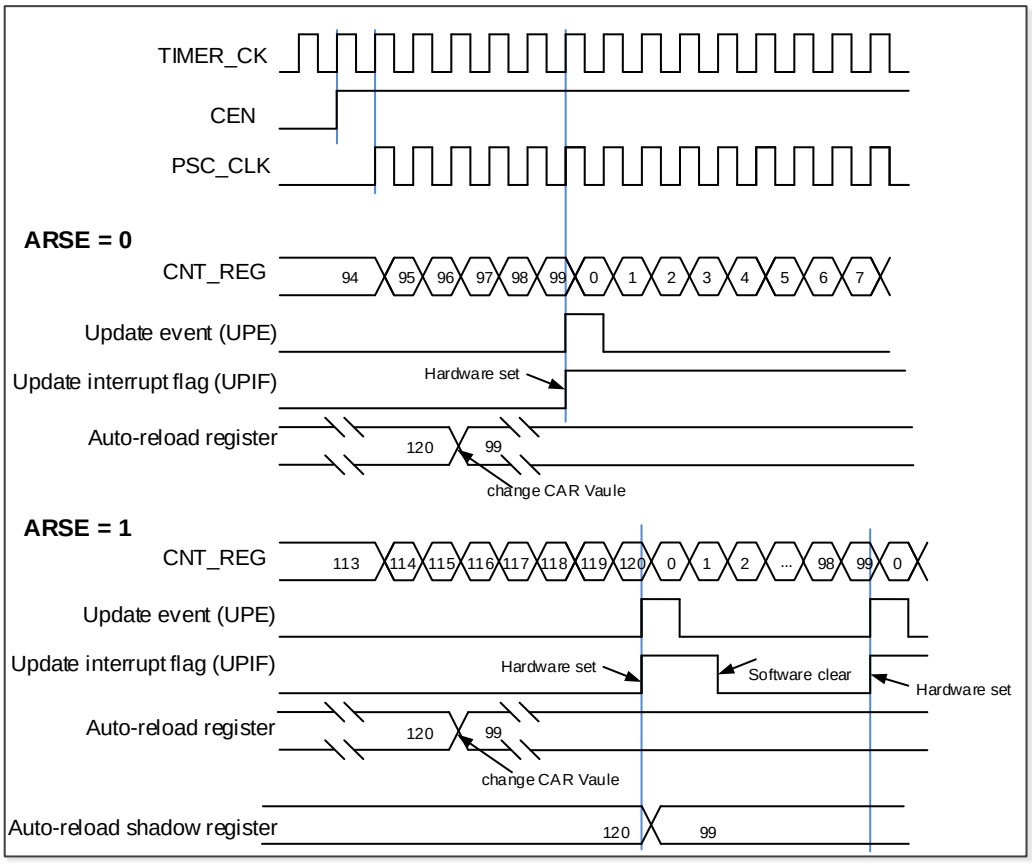

Counter down counting

In this mode, the counter counts down continuously from the counter-reload value, which is defined in the TIMERx_CAR register, to 0 in a count-down direction. Once the counter reaches to 0, the counter the counter will start counting down from the counter-reload value again and an underflow event will be generated. In addition, the update event will be generated after (TIMERx_CREP+1) times of underflow. The counting direction bit DIR in the TIMERx_CTL0 register should be set to 1 for the down-counting mode.

When the update event is set by the UPG bit in the TIMERx_SWEVG register, the counter value will be initialized to the counter reload value and an update event will be generated.

If the UPDIS bit in TIMERx_CTL0 register is set, the update event is disabled.

When an update event occurs, all the shadow registers (repetition counter register, counter auto reload register, prescaler register) are updated.

Figure 15-6. Timing chart of down counting mode, PSC=0/2 and *Figure 15-7. Timing chart of down counting mode, change TIMERx_CAR ongoing* show some examples of the counter behavior in different clock frequencies when TIMERx_CAR = 0x99.

Figure 15-6. Timing chart of down counting mode, PSC=0/2

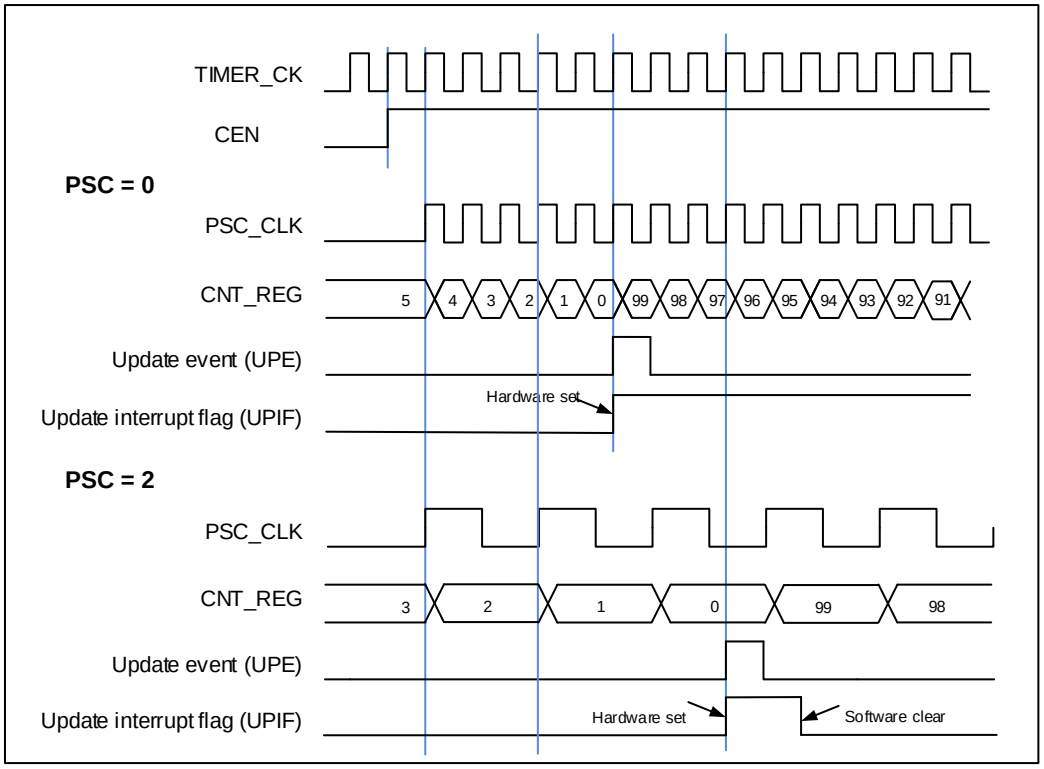

Figure 15-7. Timing chart of down counting mode, change TIMERx_CAR ongoing

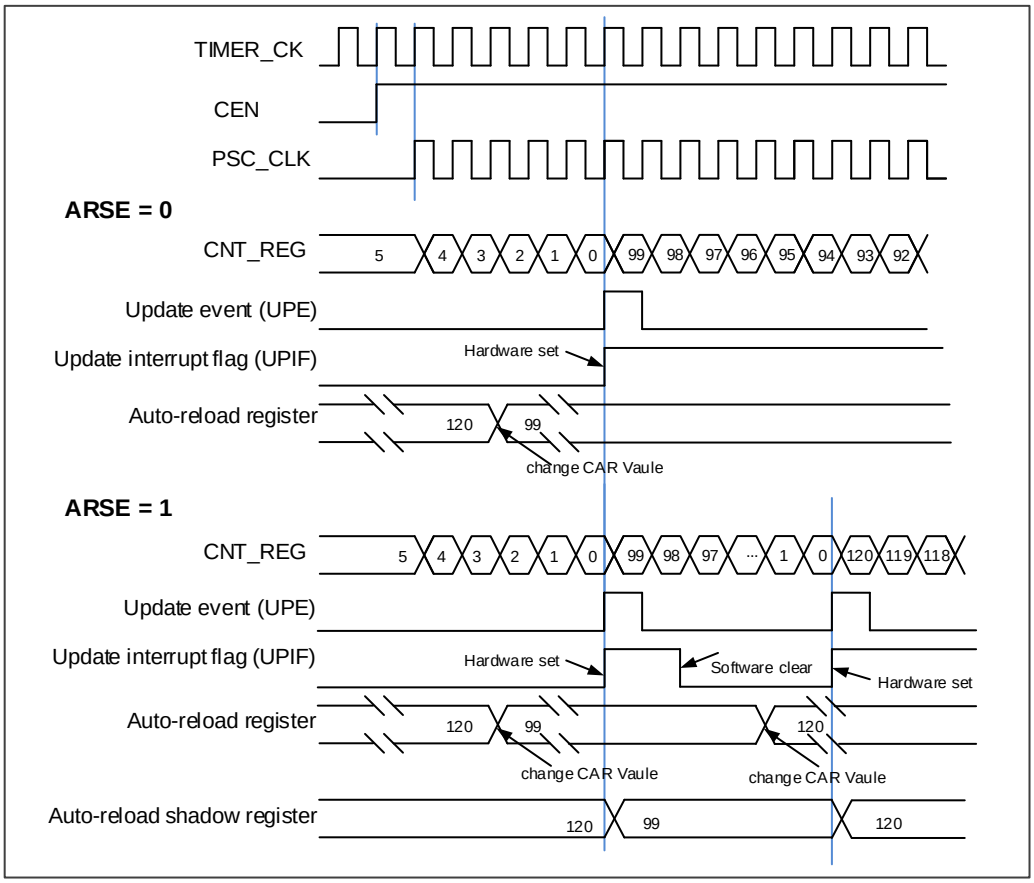


Counter center-aligned counting

In this mode, the counter counts up from 0 to the counter-reload value and then counts down to 0 alternatively. The Timer module generates an overflow event when the counter counts to the counter-reload value subtract 1 in the up-counting direction and generates an underflow event when the counter counts to 1 in the down-counting direction. The counting direction bit DIR in the TIMERx_CTL0 register is read-only and indicates the counting direction when in the center-aligned mode.

Setting the UPG bit in the TIMERx_SWEVG register will initialize the counter value to 0 and generate an update event irrespective of whether the counter is counting up or down in the center-aligned counting mode.

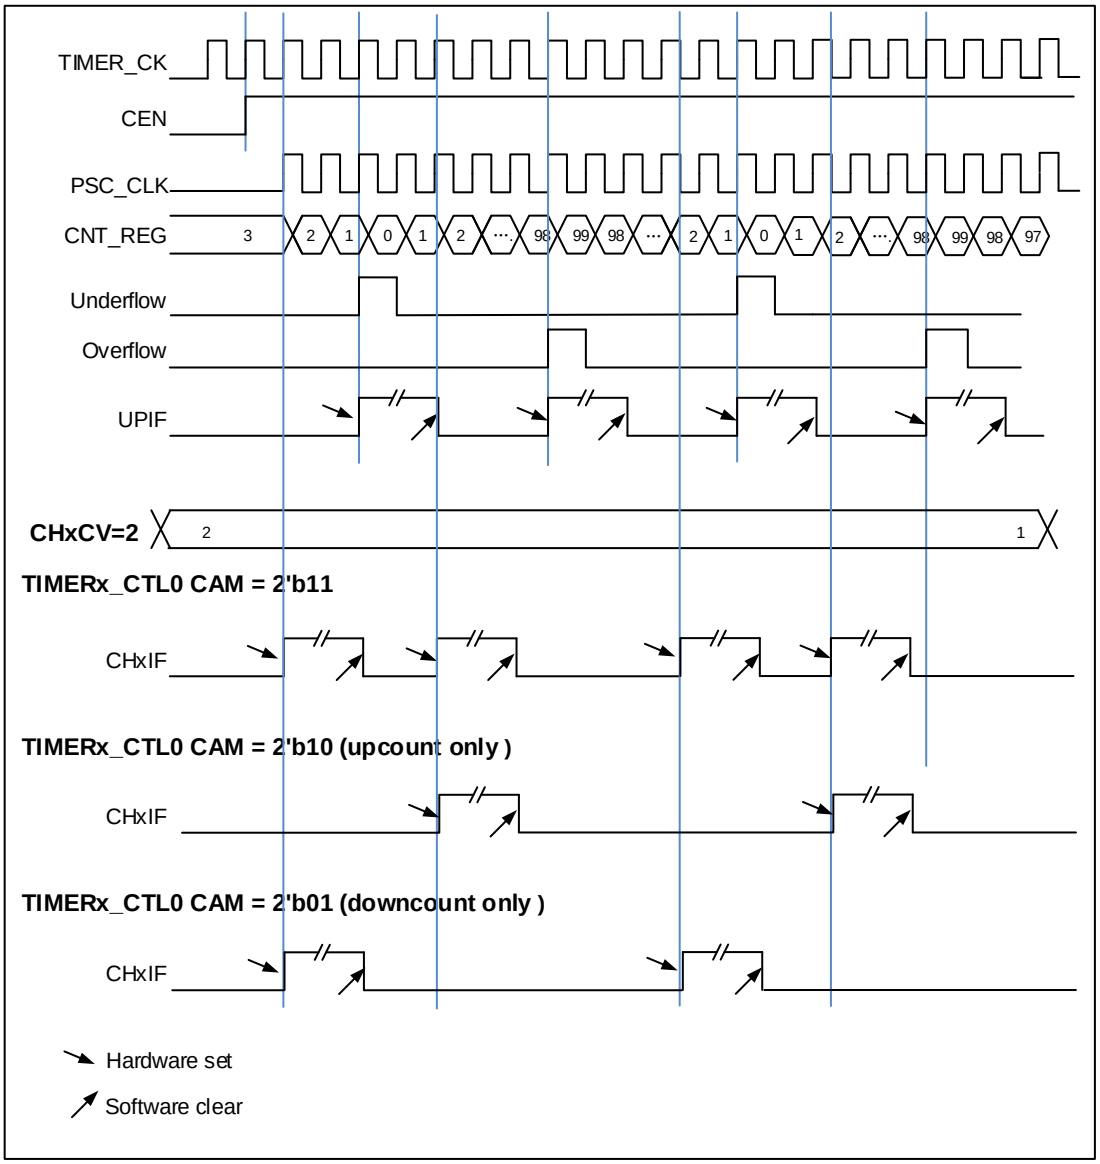
The UPIF bit in the TIMERx_INTF register will be set to 1 either when an underflow event or an overflow event occurs. While the CHxIF bit is associated with the value of CAM in TIMERx_CTL0. The details refer to ***Figure 15-8. Timing chart of center-aligned counting mode***.

If the UPDIS bit in the TIMERx_CTL0 register is set, the update event is disabled.

When an update event occurs, all the shadow registers (repetition counter register, counter auto-reload register, prescaler register) are updated.

Figure 15-8. Timing chart of center-aligned counting mode show some examples of the counter behavior when TIMERx_CAR=0x99. TIMERx_PSC=0x0

Figure 15-8. Timing chart of center-aligned counting mode



Update event (from overflow/underflow) rate configuration

The rate of update events generation (from overflow and underflow events) can be configured by the TIMERx_CREP register. Counter repetition is used to generator update event or updates the timer registers only after a given number (N+1) of cycles of the counter, where N is CREP in TIMERx_CREP register. The repetition counter is decremented at each counter overflow (does not exist in down counting mode) and underflow (does not exist in up counting mode).

Setting the UPG bit in the TIMERx_SWEVG register will reload the content of CREP in TIMERx_CREP register and generator an update event.

The new written CREP value will not take effect until the next update event. When the value

of CREP is odd, and the counter is counting in center-aligned mode, the update event is generated (on overflow or underflow) depending on when the written CREP value takes effect. If an update event is generated by software after writing an odd number to CREP, the update events will be generated on the underflow. If the next update event occurs on overflow after writing an odd number to CREP, then the subsequent update events will be generated on the overflow.

Figure 15-9. Repetition timechart for center-aligned counter

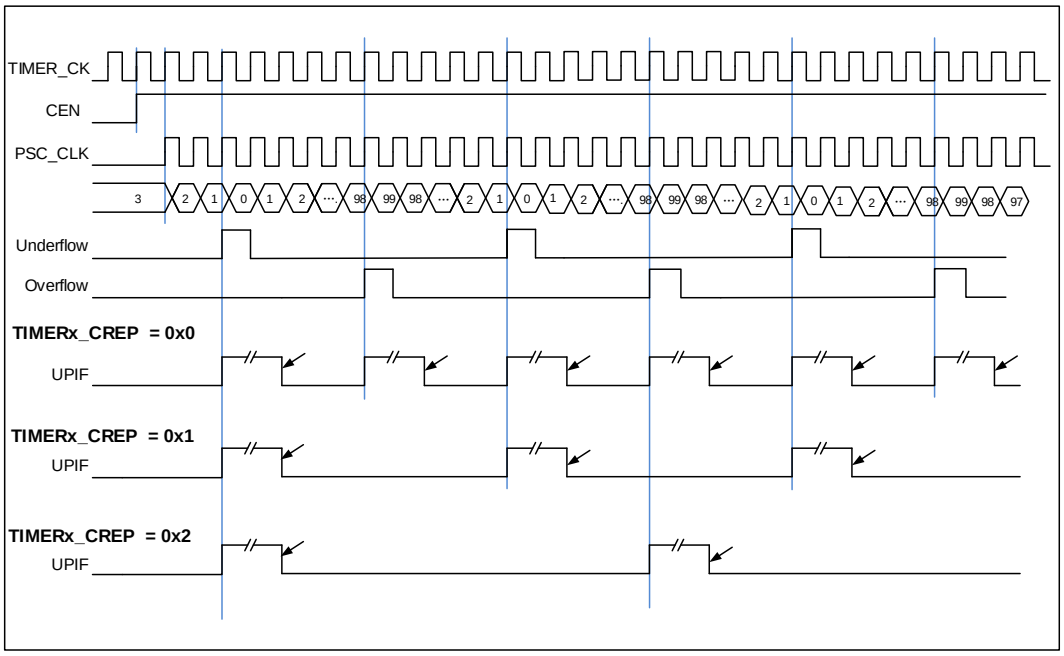


Figure 15-10. Repetition timechart for up-counter

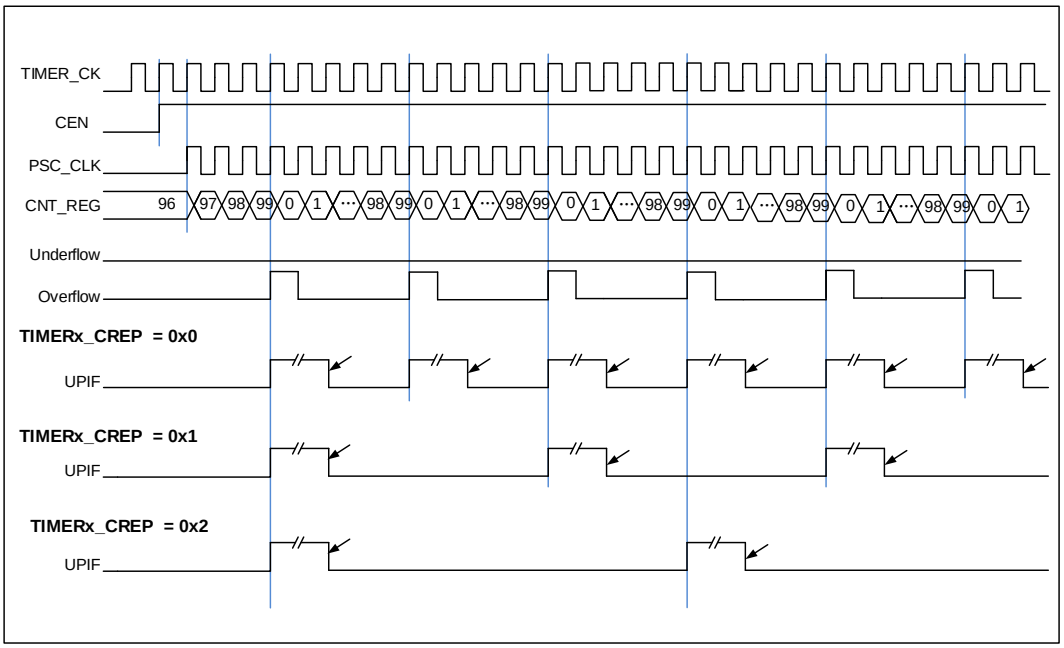

Figure 15-11. Repetition timechart for down-counter

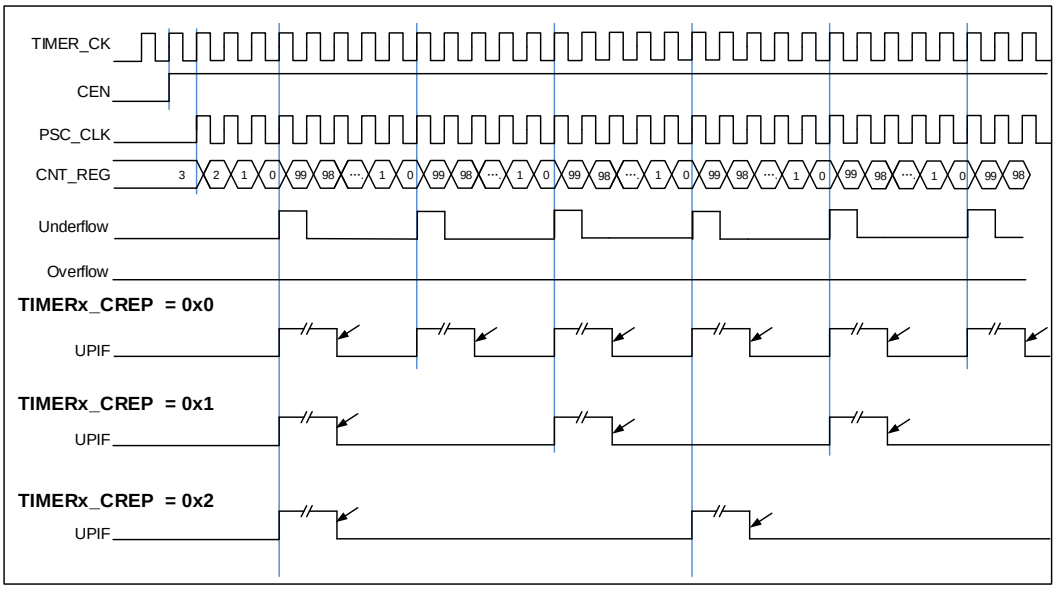


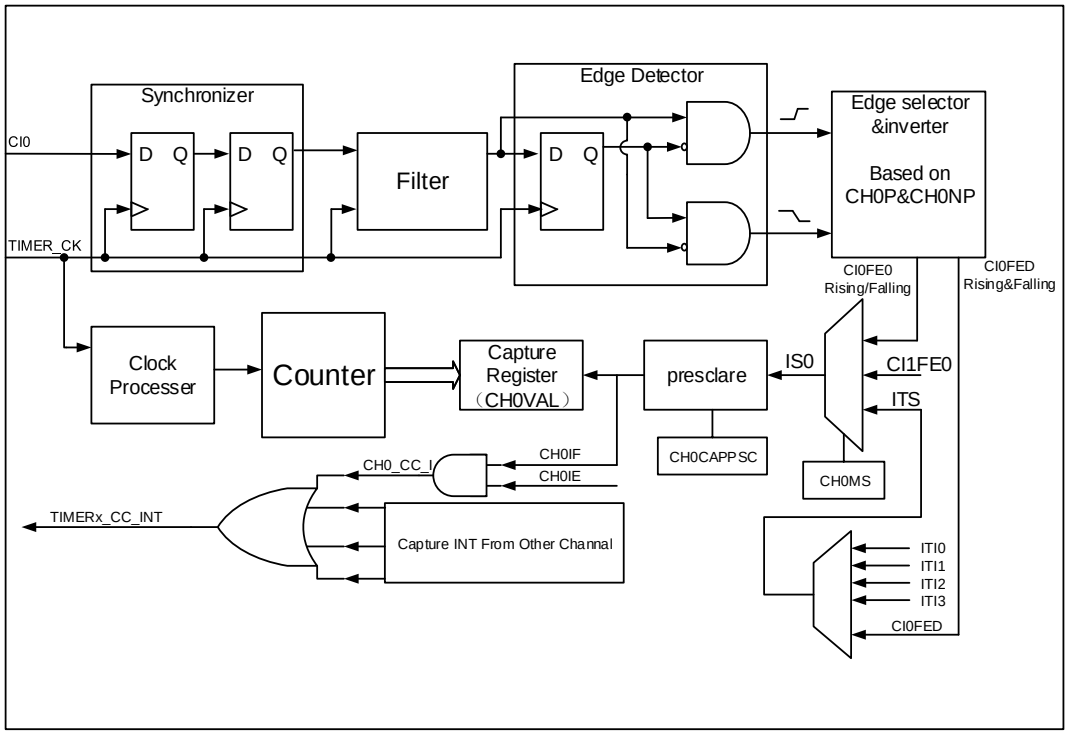
Input capture and output compare channels

The advanced timer has four independent channels which can be used as capture inputs or compare outputs. Each channel is built around a channel capture compare register including an input stage, a channel controller and an output stage.

- Channel input capture function

Channel input capture function allows the channel to perform measurements such as pulse timing, frequency, period, duty cycle and so on. The input stage consists of a digital filter, a channel polarity selection, edge detection and a channel prescaler. When a selected edge occurs on the channel input, the current value of the counter is captured into the TIMERx_CHxCV register, at the same time the CHxIF bit is set and the channel interrupt is generated if it is enabled when CHxIE=1.

Figure 15-12. Channel input capture principle



The input signals of channelx (CIx) can be the TIMERx_CHx signal or the XOR signal of the TIMERx_CH0, TIMERx_CH1 and TIMERx_CH2 signals. First, the input signal of channel (CIx) is synchronized to TIMER_CK signal, and then sampled by a digital filter to generate a filtered input signal. Then through the edge detector, the rising or falling edge is detected by configuring CHxP bit. The input capture signal can also be selected from the input signal of other channel or the internal trigger signal by configuring CHxMS bits. The IC prescaler makes several input events generate one effective capture event. On the capture event, TIMERx_CHxCV will store the value of counter.

So the process can be divided to several steps as below:

Step1: Filter configuration (CHxCAPFLT in TIMERx_CHCTL0).
Based on the input signal and quality of requested signal, configure compatible CHxCAPFLT.

Step2: Edge selection (CHxP/CHxNP in TIMERx_CHCTL2).
Rising edge or falling edge, choose one by configuring CHxP/CHxNP bits.

Step3: Capture source selection (CHxMS in TIMERx_CHCTL0).
As soon as selecting one input capture source by CHxMS, the channel must be set to input mode (CHxMS! =0x0) and TIMERx_CHxCV cannot be written any more.

Step4: Interrupt enable (CHxIE and CHxDEN in TIMERx_DMAINTEN).
Enable the related interrupt to get the interrupt and DMA request.

Step5: Capture enable (CHxEN in TIMERx_CHCTL2).

Result: When the wanted input signal is captured, TIMERx_CHxCV will be set by counter's value and CHxIF is asserted. If the CHxIF is 1, the CHxOF will also be asserted. The interrupt and DMA request will be asserted or not based on the configuration of CHxIE

and CHxDEN in TIMERx_DMAINTEN.

Direct generation: A DMA request or interrupt is generated by setting CHxG directly.

The channel input capture function can be also used for pulse width measurement from signals on the TIMERx_CHx pins. For example, PWM signal connects to CI0 input. Select CI0 as channel 0 capture signals by setting CH0MS to 2'b01 in the channel control register (TIMERx_CHCTL0) and set capture on rising edge. Select CI0 as channel 1 capture signal by setting CH1MS to 2'b10 in the channel control register (TIMERx_CHCTL0) and set capture on falling edge. The counter is set to restart mode and is restarted on channel 0 rising edge. Then the TIMERX_CH0CV can measure the PWM period and the TIMERx_CH1CV can measure the PWM duty cycle.

- Channel output compare function

Figure 15-13. Channel Output compare principle (with complementary output, x=0,1,2)

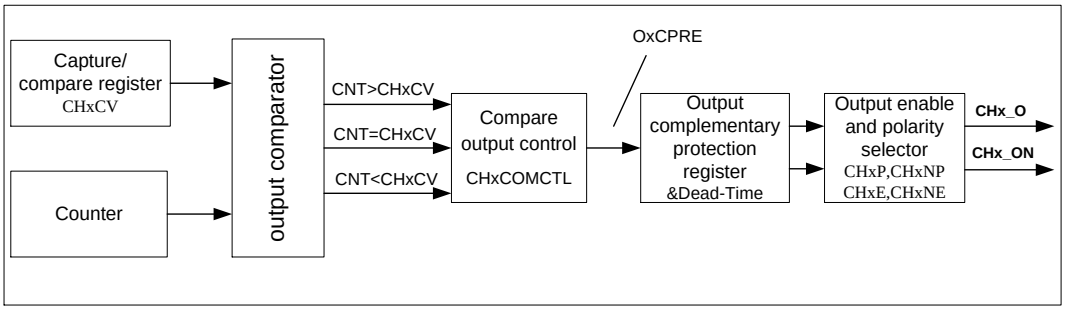


Figure 15-14. Channel output compare principle (CH3_O)

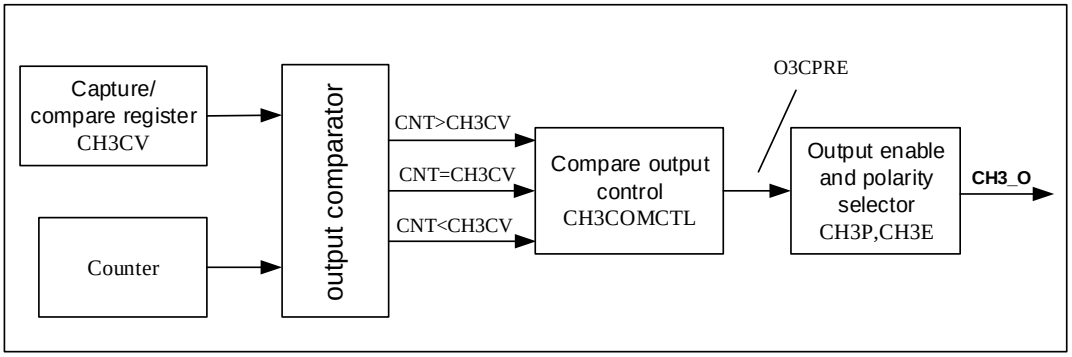

Figure 15-13. Channel Output compare principle (with complementary output, x=0,1,2) and ***Figure 15-14. Channel output compare principle (CH3_O)*** show the principle circuit of output compare function. The relationship between the channel output signal CHx_O/CHx_ON and the OxCPRE signal (more details refer to ***Channel output prepare signal***) is described as blew: The active level of O0CPRE is high, the output level of CH0_O/CH0_ON depends on OxCPRE signal, CHxP/CHxNP bit and CH0E/CH0NE bit (please refer to the TIMERx_CHCTL2 register for more details). For examples,

1) Configure CHxP=0 (the active level of CHx_O is high, the same as OxCPRE), CHxE=1 (the output of CHx_O is enabled),
   If the output of OxCPRE is active(high) level, the output of CHx_O is active(high) level;
   If the output of OxCPRE is inactive(low) level, the output of CHx_O is active(low) level.

2) Configure CHxNP=0 (the active level of CHx_ON is low, contrary to OxCPRE), CHxNE=1 (the output of CHx_ON is enabled),
   If the output of OxCPRE is active(high) level, the output of CHx_O is active(low) level;
   If the output of OxCPRE is inactive(low) level, the output of CHx_O is active(high) level.

When CH0_O and CH0_ON are output at the same time, the specific outputs of CH0_O and CH0_ON are related to the relevant bits (ROS, IOS, POE and DTCFG bits) in the TIMERx_CCHP register. Please refer to ***Channel output complementary PWM*** for more details.

In channel output compare function, the TIMERx can generate timed pulses with programmable position, polarity, duration and frequency. When the counter matches the value in the TIMERx_CHxCV register of an output compare channel, the channel (n) output can be set, cleared, or toggled based on CHxCOMCTL. When the counter reaches the value in the TIMERx_CHxCV register, the CHxIF bit will be set and the channel (n) interrupt is generated if CHxIE = 1. And the DMA request will be asserted, if CxCDE=1.

So the process can be divided into several steps as below:

Step1: Clock Configuration. Such as clock source, clock prescaler and so on.

Step2: Compare mode configuration.

- Set the shadow enable mode by CHxCOMSEN
- Set the output mode (set/clear/toggle) by CHxCOMCTL.
- Select the active polarity by CHxP/CHxNP
- Enable the output by CHxEN

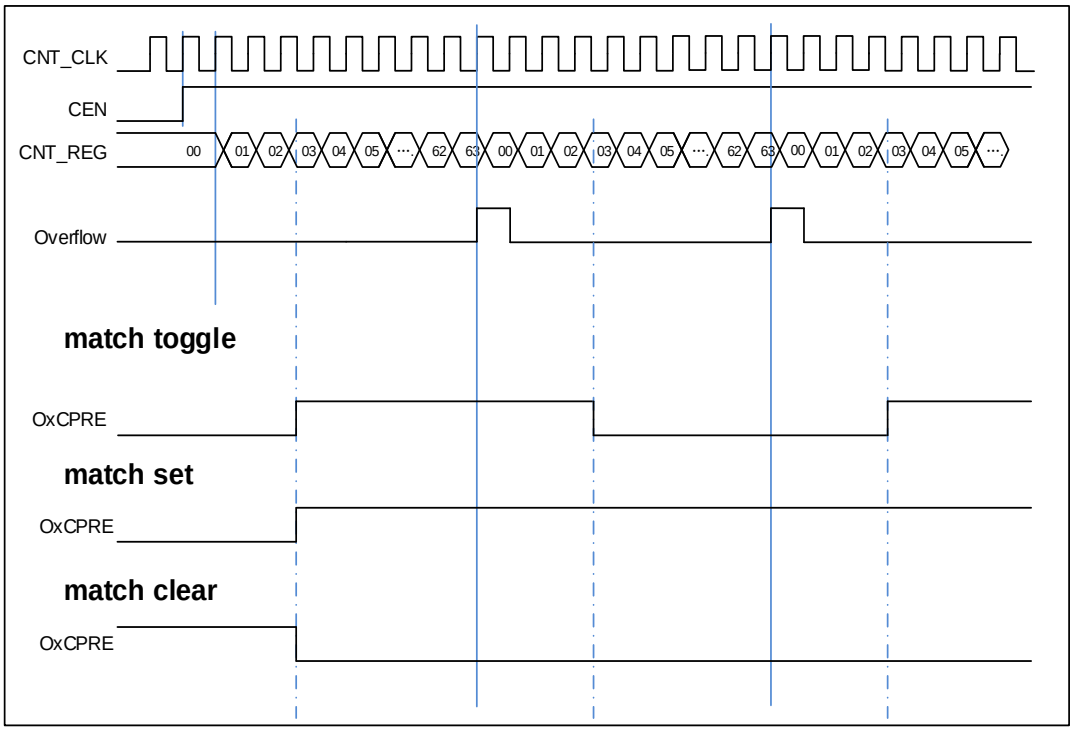
Step3: Interrupt/DMA-request enable configuration by CHxIE/CHxDEN.

Step4: Compare output timing configuration by TIMERx_CAR and TIMERx_CHxCV
The TIMERx_CHxCV can be changed ongoing to meet the expected waveform.

Step5: Start the counter by configuring CEN to 1.

Figure 15-15. Output-compare in three modes show the three compare modes toggle/set/clear. CAR=0x63, CHxVAL=0x3

Figure 15-15. Output-compare in three modes



Output PWM function

In the output PWM function (by setting the CHxCOMCTL bit to 3'b110 (PWM mode 0) or to 3'b 111(PWM mode 1)), the channel can generate PWM waveform according to the TIMERx_CAR registers and TIMERx_CHxCV registers.

Based on the counter mode, PWM can also be divided into EAPWM (Edge-aligned PWM) and CAPWM (Center-aligned PWM).

The EAPWM's period is determined by TIMERx_CAR and the duty cycle is determined by TIMERx_CHxCV. ***Figure 15-16. Timing chart of EAPWM*** shows the EAPWM output and interrupts waveform.

The CAPWM's period is determined by 2*TIMERx_CAR, the duty cycle is determined by 2*TIMERx_CHxCV.***Figure 15-17. Timing chart of CAPWM*** shows the CAPWM output and interrupts waveform.

In up counting mode, if the value of TIMERx_CHxCV is greater than the value of TIMERx_CAR, the output will be always inactive in PWM mode 0 (CHxCOMCTL=3'b110). And if the value of TIMERx_CHxCV is greater than the value of TIMERx_CAR, the output will be always active in PWM mode 1 (CHxCOMCTL=3'b111).

Figure 15-16. Timing chart of EAPWM

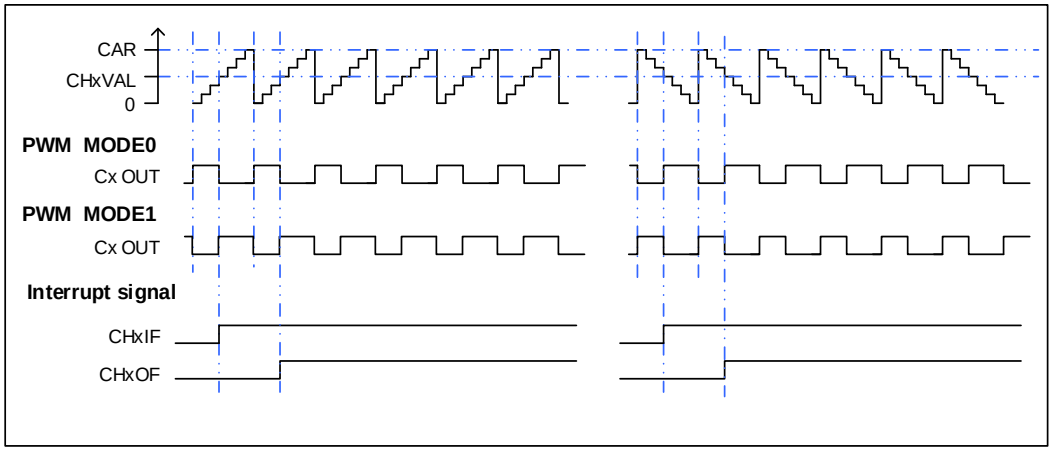


Figure 15-17. Timing chart of CAPWM

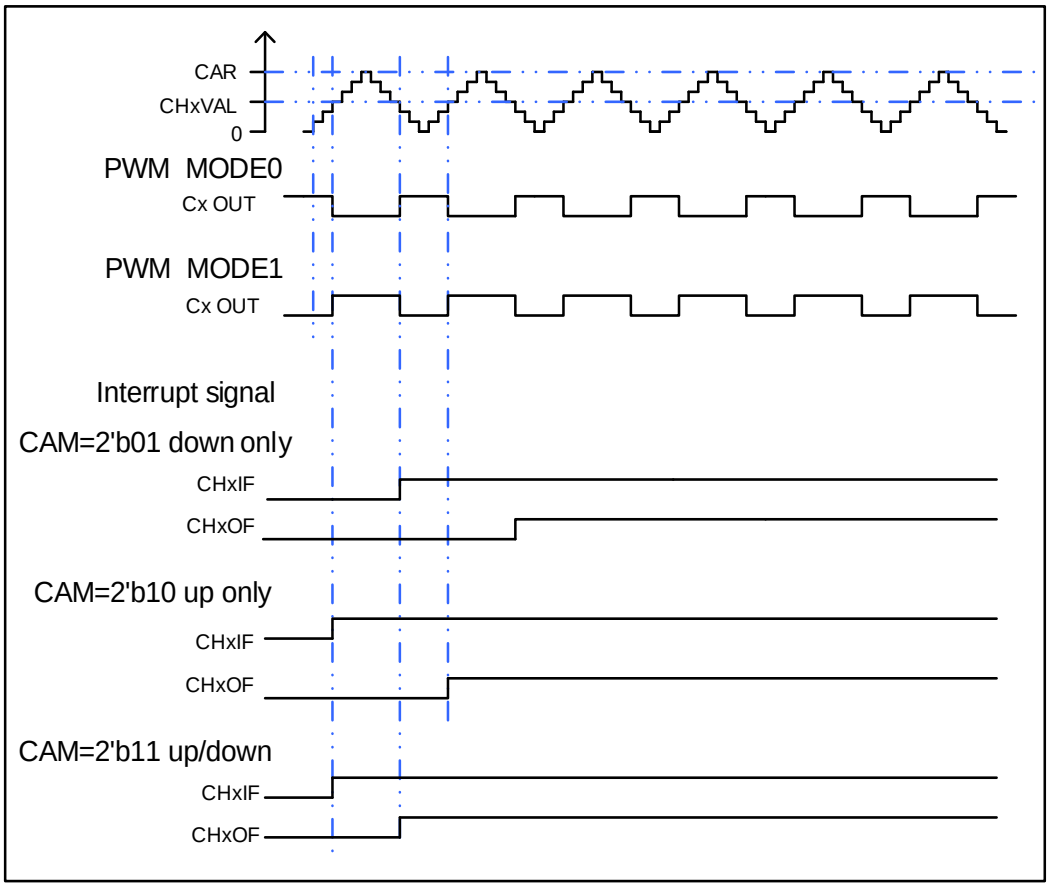


Channel output prepare signal

As is shown in ***Figure 15-13. Channel Output compare principle (with complementary output, x=0,1,2)***, when TIMERx is configured in compare match output mode, a middle signal which is OxCPRE signal (Channel x output prepare signal) will be generated before the channel outputs signal. The OxCPRE signal type is defined by configuring the CHxCOMCTL

bit. The OxCPRE signal has several types of output function. These include keeping the original level by configuring the CHxCOMCTL field to 0x00, setting to high by configuring the CHxCOMCTL field to 0x01, setting to low by configuring the CHxCOMCTL field to 0x02 or toggling signal by configuring the CHxCOMCTL field to 0x03 when the counter value matches the content of the TIMERx_CHxCV register.

The PWM mode 0/PWM mode 1 output is another output type of OxCPRE which is setup by configuring the CHxCOMCTL field to 0x06/0x07. In these modes, the OxCPRE signal level is changed according to the counting direction and the relationship between the counter value and the TIMERx_CHxCV content. Refer to the definition of relative bit for more details.

Another special function of the OxCPRE signal is a forced output which can be achieved by configuring the CHxCOMCTL field to 0x04/0x05. The output can be forced to an inactive/active level irrespective of the comparison condition between the values of the counter and the TIMERx_CHxCV.

Configure the CHxCOMCEN bit to 1 in the TIMERx_CHCTL0 register, the OxCPRE signal can be forced to 0 when the ETIFP signal derived from the external ETI pin is set to a high level. The OxCPRE signal will not return to its active level until the next update event occurs.

Channel output complementary PWM

Function of complementary is for a pair of channels, CHx_O and CHx_ON, the two output signals cannot be active at the same time. The TIMERx has 4 channels, but only the first three channels have this function. The complementary signals CHx_O and CHx_ON are controlled by a group of parameters: the CHxEN and CHxNEN bits in the TIMERx_CHCTL2 register, the POEN, ROS and IOS bits in the TIMERx_CCHP register, ISOx and ISOxN bits in the TIMERx_CTL1 register. The output polarity is determined by CHxP and CHxNP bits in the TIMERx_CHCTL2 register.

Table 15-2. Complementary outputs controlled by parameters

Complementary Parameters					Output Status	
POEN	ROS	IOS	CHxEN	CHxNEN	CHx_O	CHx_ON
0	0/1	0	0	0	CHx_O / CHx_ON = LOW CHx_O / CHx_ON output disable(1).	
				1	CHx_O/ CHx_ON output “off-state” (2): the CHx_O/ CHx_ON output inactive level firstly: CHx_O = CHxP, CHx_ON = CHxNP; If the clock for deadtime generator is present, after a deadtime: CHx_O = ISOx, CHx_ON = ISOxN. (3)	
			1	0		
				1		
		1	x	x	CHx_O/ CHx_ON output “off-state”: the CHx_O/ CHx_ON output inactive level firstly: CHx_O = CHxP, CHx_ON = CHxNP; If the clock for deadtime generator is present, after a deadtime: CHx_O = ISOx, CHx_ON = ISOxN.	
1	0	0/1	0	0	CHx_O/CHx_ON = LOW CHx_O/CHx_ON output disable.	
				1	CHx_O = LOW CHx_O output disable.	CHx_ON =OxCPRE⊕(4)CHxNP CHx_ON output enable.
			1	0	CHx_O=OxCPRE⊕CHxP CHx_O output enable.	CHx_ON = LOW CHx_ON output disable.
				1	CHx_O=OxCPRE⊕CHxP CHx_O output enable.	CHx_ON =(!OxCPRE)(5)⊕CHxNP. CHx_ON output enable.
	1		0	0	CHx_O = CHxP CHx_O output “off-state”.	CHx_ON = CHxNP CHx_ON output “off-state”.
				1	CHx_O = CHxP CHx_O output “off-state”	CHx_ON =OxCPRE⊕CHxNP CHx_ON output enable
			1	0	CHx_O=OxCPRE⊕CHxP CHx_O output enable	CHx_ON = CHxNP CHx_ON output “off-state”.
				1	CHx_O=OxCPRE⊕CHxP CHx_O output enable	CHx_ON =(!OxCPRE)⊕CHxNP CHx_ON output enable.

Note:

(1) output disable: the CHx_O / CHx_ON are disconnected to corresponding pins, the pin is floating with GPIO pull up/down setting which will be Hi-Z if no pull.

(2) “off-state”: CHx_O / CHx_ON output with inactive state (e.g., CHx_O = 0⊕CHxP = CHxP).

(3) See Break mode section for more details.

(4) ⊕: Xor calculate.

(5) (!OxCPRE)：the complementary output of the OxCPRE signal.

Insertion dead time for complementary PWM

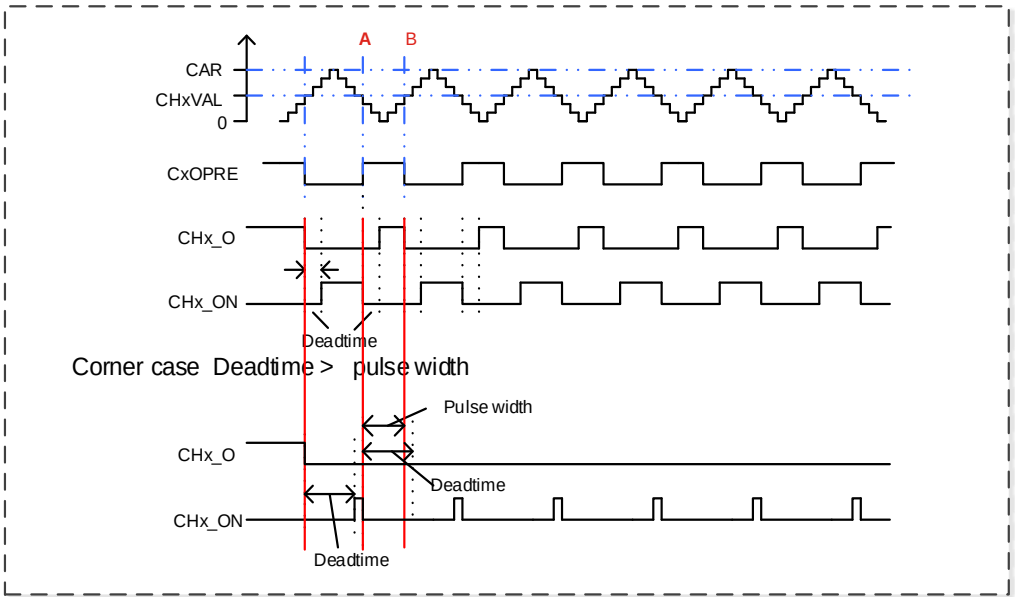
The dead time insertion is enabled when both CHxEN and CHxNEN are configured to 1'b1, it is also necessary to configure POEN to 1. The field named DTCFG defines the dead time delay that can be used for all channels except channel 3. Refer to the TIMERx_CCHP register for details about the delay time.

The dead time delay insertion ensures that two complementary signals are not active at the same time.

When the channelx match event (TIMERx counter = CHxVAL) occurs, OxCPRE will be toggled in PWM mode 0. At point A in ***Figure 15-18. Complementary output with dead time insertion*** CHx_O signal remains at the low level until the end of the dead time delay, while CHx_ON signal will be cleared at once. Similarly, at point B when the channelx match event (TIMERx counter = CHxVAL) occurs again, OxCPRE is cleared, and CHx_O signal will be cleared at once, while CHx_ON signal remains at the low level until the end of the dead time delay.

Sometimes, we can see corner cases about the dead time insertion. For example: the dead time delay is greater than or equal to the duty cycle of the CHx_O signal, then the CHx_O signal is always inactive. (as show in the ***Figure 15-18. Complementary output with dead time insertion***)

Figure 15-18. Complementary output with dead time insertion



Break mode

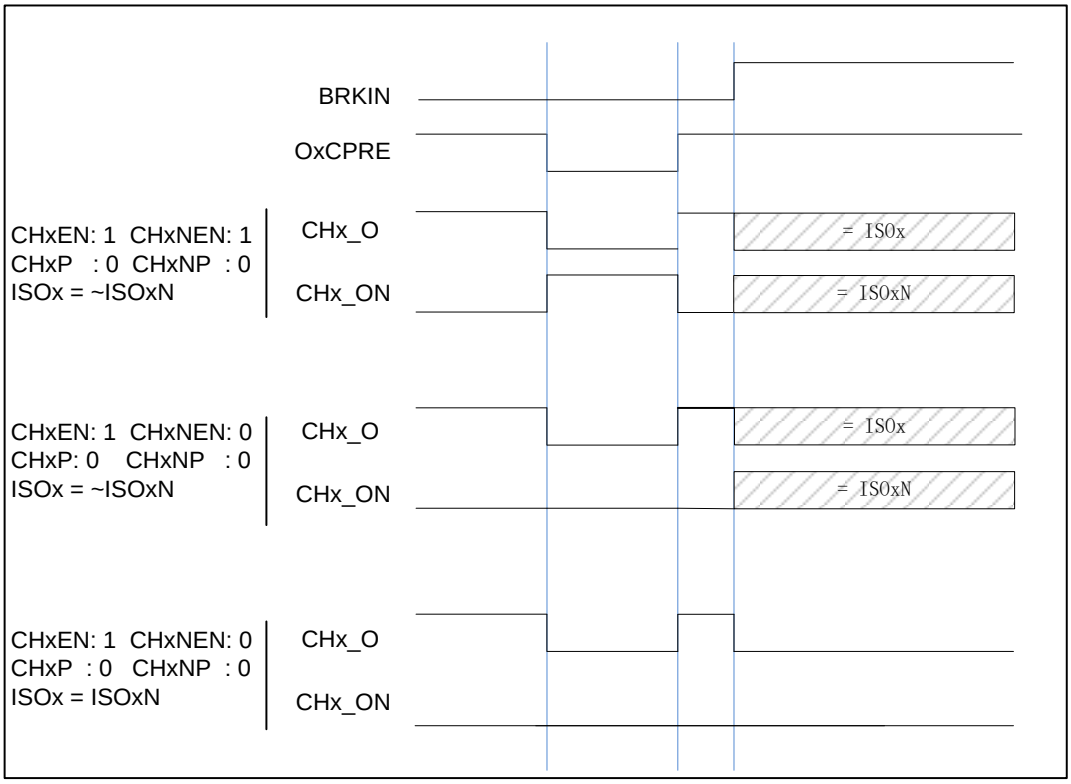
In this mode, CHx_O and CHx_ON are controlled by the POEN, IOS and ROS bits in the TIMERx_CCHP register, ISOx and ISOxN bits in the TIMERx_CTL1 register. In any case, CHx_O and CHx_ON signals cannot be set to active level at the same time. The break sources are input break pin and HXTAL stuck event which is generated by Clock Monitor

(CKM) in RCU. The break function is enabled by setting the BRKEN bit in the TIMERx_CCHP register. The break input polarity is configured by the BRKP bit in TIMERx_CCHP register.

When a break occurs, the POEN bit is cleared asynchronously. As soon as POEN is 0, the level of the CHx_O and CHx_ON outputs are determined by the ISOx and ISOxN bits in the TIMERx_CTL1 register. If IOS is 0, the timer releases the enable output, otherwise, the enable output remains high. The complementary outputs are first in the reset state, and then the dead time generator is reactivated to drive the outputs with the level programmed in the ISOx and ISOxN bits after a dead time.

When a break occurs, the BRKIF bit in the TIMERx_INTF register will be set. If BRKIE is 1, an interrupt will be generated.

Figure 15-19. Output behavior of the channel in response to a break (the break high active)



Quadrature decoder

The quadrature decoder function uses two quadrature inputs CI0FE0 and CI1FE1 derived from the TIMERx_CH0 and TIMERx_CH1 pins respectively to interact to control the counter value. The DIR bit is modified during each input source transition. The counter can be changed by the edges of CI0FE0 only, CI1FE1 only or both CI0FE0 and CI1FE1, the selection mode by setting the SMC[2:0] to 0x01, 0x02 or 0x03. The mechanism for changing the counter direction is shown in ***Table 15-3. Counting direction in different quadrature decoder mode***. The quadrature decoder can be regarded as an external clock with a directional selection. This means that the counter counts continuously in the interval between 0 and the counter-period value. Therefore, TIMERx_CAR register must be configured before

the counter starts to count.

Table 15-3. Counting direction in different quadrature decoder mode

Counting mode	Level	CI0FE0		CI1FE1	
		Rising	Falling	Rising	Falling
Quadrature decoder mode 0 SMC[2:0]=3'b000	CI1FE1=1	Down	Up	-	-
	CI1FE1=0	Up	Down	-	-
Quadrature decoder mode 1 SMC [2:0]=3'b010	CI0FE0=1	-	-	Up	Down
	CI0FE0=0	-	-	Down	Up
Quadrature decoder mode 2 SMC [2:0]=3'b011	CI1FE1=1	Down	Up	X	X
	CI1FE1=0	Up	Down	X	X
	CI0FE0=1	X	X	Up	Down
	CI0FE0=0	X	X	Down	Up

Note: "-" means "no counting"; "X" means impossible. "0" means "low level", "1" means "high level".

Figure 15-20. Counter behavior with CI0FE0 polarity non-inverted in mode 2

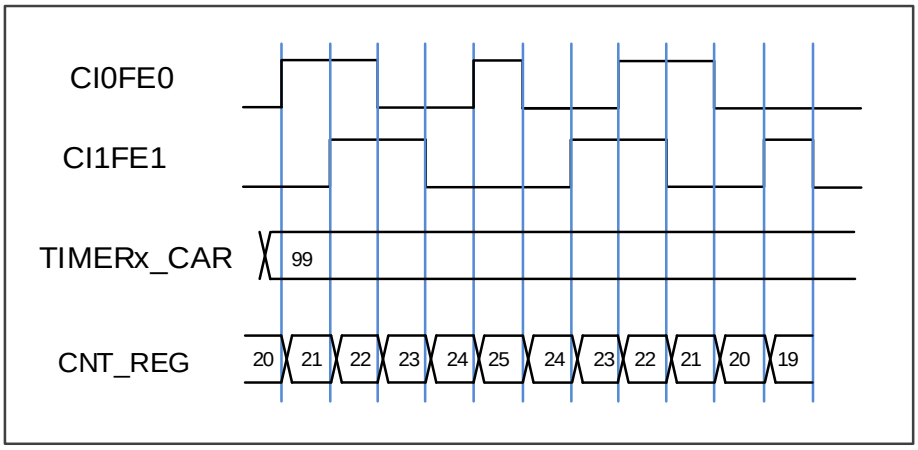


Figure 15-21. Counter behavior with CI0FE0 polarity inverted in mode 2

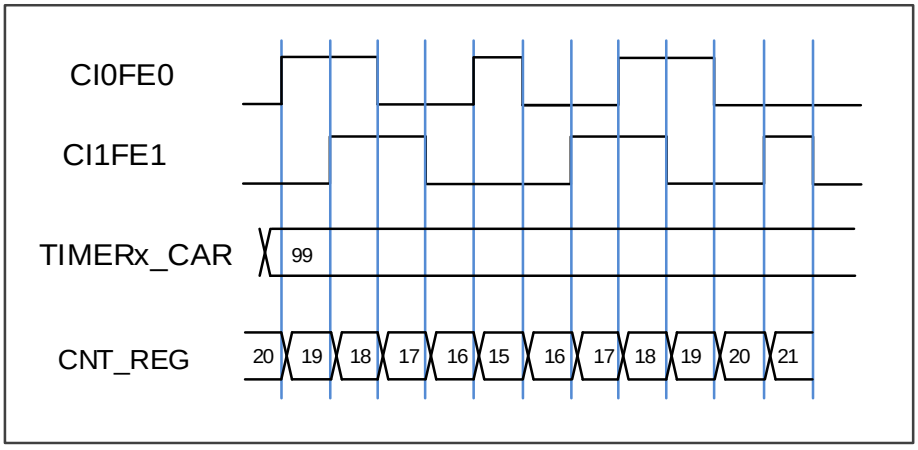

Hall sensor function

Hall sensor is generally used to control BLDC Motor; advanced timer can support this function.

Figure 15-22. Hall sensor is used to BLDC motor show how to connect. And we can see we need two timers. First TIMER_in (Advanced/GeneralL0 TIMER) should accept three HALL sensor signals.

Each of the three input of HALL sensors provides a pulse that applied to an input capture pin, can then be analyzed and both speed and position can be deduced.

By the internal connection such as TRGO-ITIx, TIMER_in and TIMER_out can be connected. TIMER_out will generate PWM signal to control BLDC motor's speed based on the ITRx. Then, the feedback circuit is finished, also you change configuration to fit your request.

About the TIMER_in, it need have input XOR function, so you can choose from Advanced/GeneralL0 TIMER.

And TIMER_out need have functions of complementary and Dead-time, so only advanced timer can be chosen. Else, based on the timers' internal connection relationship, pair's timers can be selected.

TIMER_in (TIMER2) -> TIMER_out (TIMER0 ITI2)

And so on.

After getting appropriate timers combination, and wire connection, we need to configure timers. Some key settings include:

- Enable XOR by setting TI0S, then, each of input signal change will make the CI0 toggle. CH0VAL will record the value of counter at that moment.
- Enable ITIx connected to commutation function directly by setting CCUC and CCSE.
- Configuration PWM parameter based on your request.

Figure 15-22. Hall sensor is used to BLDC motor

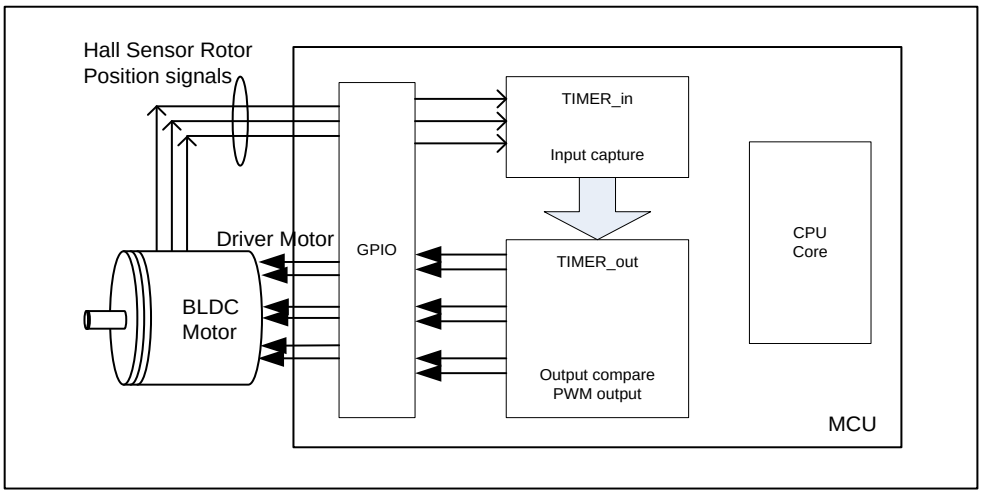

Figure 15-23. Hall sensor timing between two timers

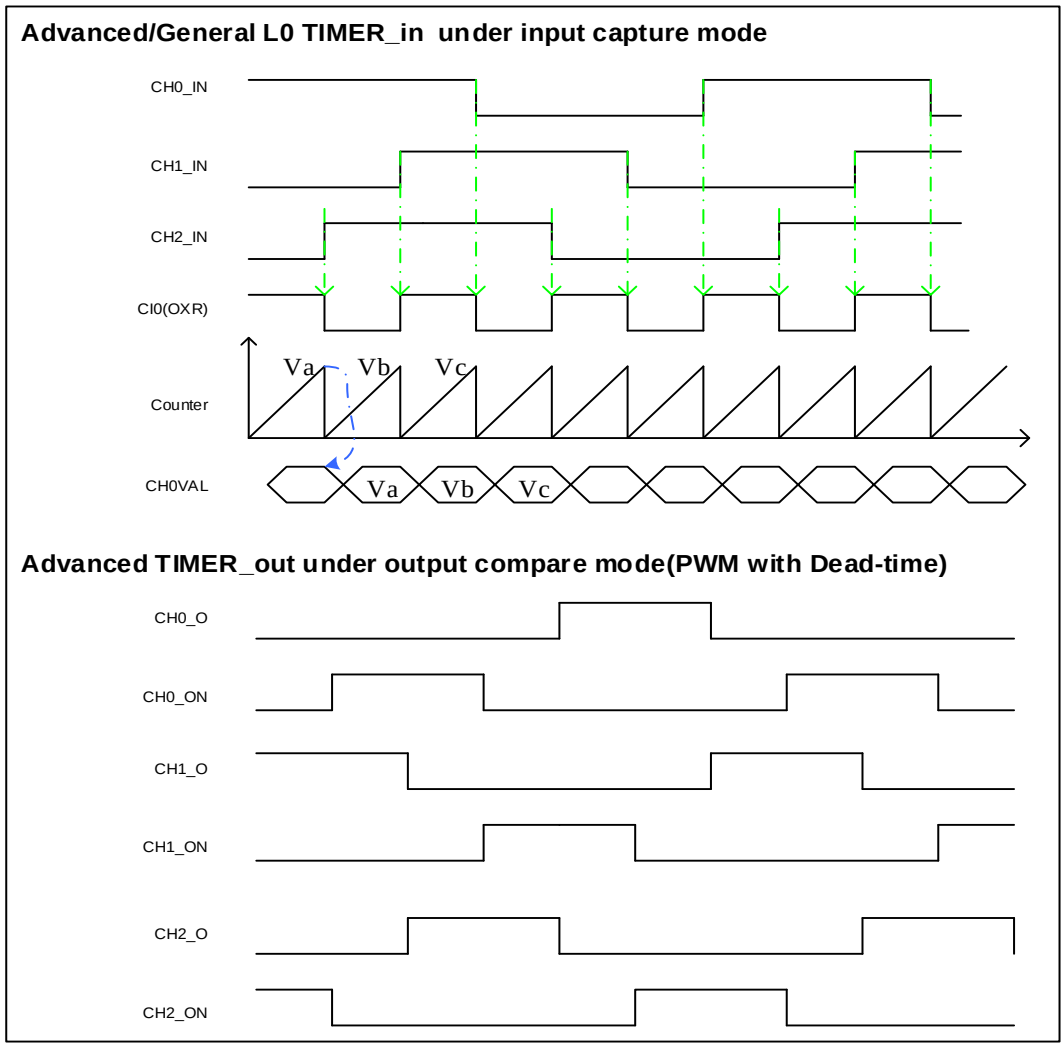

Master-slave management

The TIMERx can be synchronized with a trigger in several modes including restart mode, pause mode and event mode which is selected by the SMC[2:0] bits in the TIMERx_SMCFG register. The input trigger of these modes can be selected by the TRGS[2:0] bits in the TIMERx_SMCFG register.

Table 15-4. Slave mode example table

	Mode Selection	Source Selection	Polarity Selection	Filter and Prescaler
LIST	SMC[2:0] 3'b100 (restart mode) 3'b101 (pause mode) 3'b110 (event mode)	TRGS[2:0] 000: ITI0 001: ITI1 010: ITI2 011: ITI3 100: CI0F_ED 101: CI0FE0	If CI0FE0 or CI1FE1 is selected as the trigger source, configure the CHxP and CHxNP for the polarity selection and inversion.	For the ITIx, no filter and prescaler can be used. For the CIx, filter can be used by configuring CHxCAPFLT, no prescaler can be used.

<table>
<tr><th></th><th>Mode Selection</th><th>Source Selection</th><th>Polarity Selection</th><th>Filter and Prescaler</th></tr>
<tr><td></td><td></td><td>110: CI1FE1

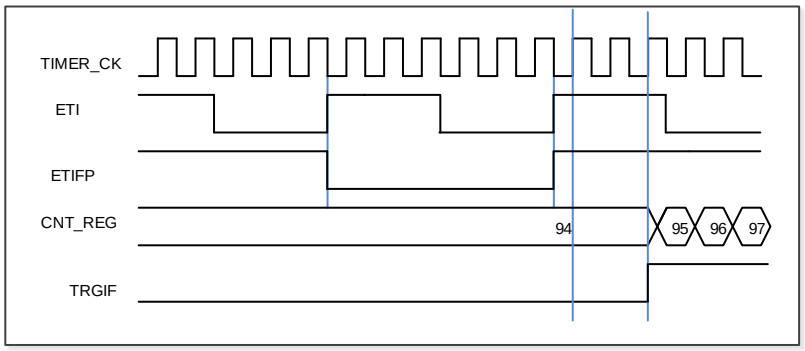
</table>

	Mode Selection	Source Selection	Polarity Selection	Filter and Prescaler
Exam3	**Event mode** The counter will start to count when a rising edge of trigger input comes.	TRGS[2:0] =3'b111 ETIFP is selected.	ETP = 0, the polarity of ETI does not change.	ETPSC = 1, ETI is divided by 2. ETFC = 0, ETI does not filter.

Figure 15-26. Event mode



Single pulse mode

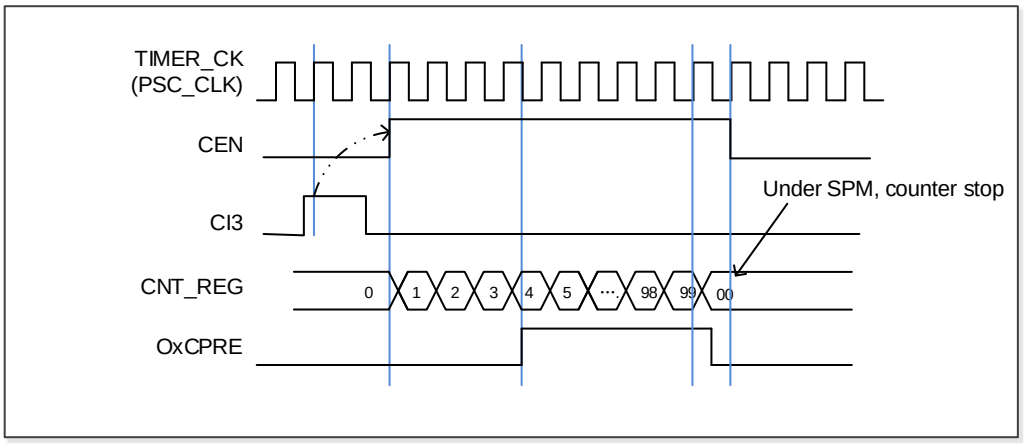
Single pulse mode is enabled by setting SPM in TIMERx_CTL0. If SPM is set, the counter will be cleared and stopped when the next update event occurs. In order to get a pulse waveform, the TIMERx is configured to PWM mode or compare mode by CHxCOMCTL.

Once the timer is set to the single pulse mode, it is not necessary to configure the timer enable bit CEN in the TIMERx_CTL0 register to 1 to enable the counter. Setting the CEN bit to 1 or a trigger signal edge can generate a pulse and then keep the CEN bit at a high state until the update event occurs or the CEN bit is written to 0 by software. If the CEN bit is cleared to 0 by software, the counter will be stopped and its value will be held.

In the single pulse mode, the active edge of trigger which sets the CEN bit to 1 will enable the counter. However, there exists several clock delays to perform the comparison result between the counter value and the TIMERx_CHxCV value. In order to reduce the delay to a minimum value, the user can set the CHxCOMFEN bit in TIMERx_CHCTL0/1 register. After a trigger rising occurs in the single pulse mode, the OxCPRE signal will immediately be forced to the state which the OxCPRE signal will change to, as the compare match event occurs without taking the comparison result into account. The CHxCOMFEN bit is available only when the output channel is configured to the PWM mode 0 or PWM mode 1 and the trigger source is derived from the trigger signal.

Figure 15-27. Single pulse mode, TIMERx_CHxCV = 4, TIMERx_CAR=99 shows an example.

Figure 15-27. Single pulse mode, TIMERx_CHxCV = 4, TIMERx_CAR=99

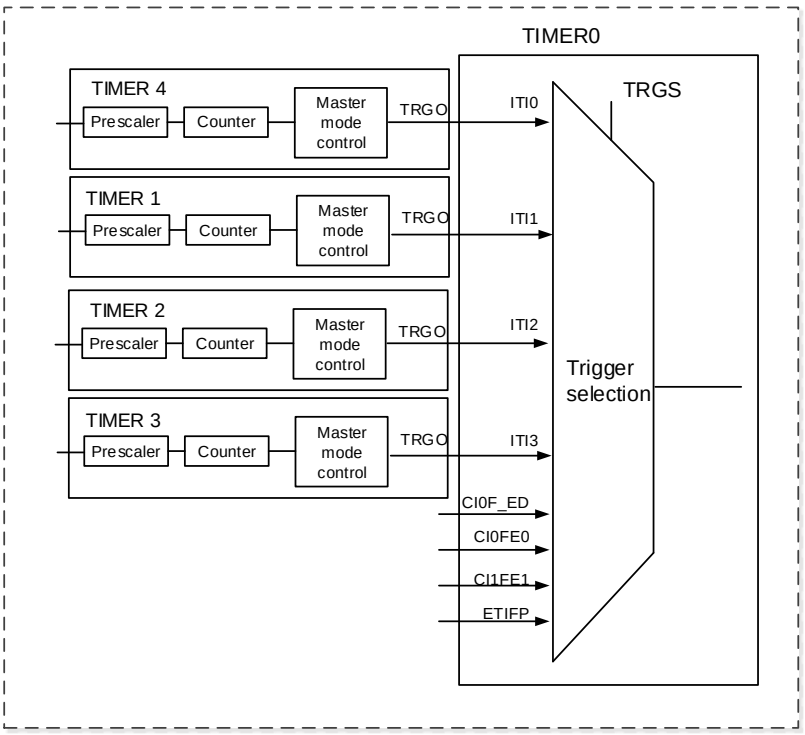


Timers interconnection

Timer can be configured as interconnection, that is, one timer which operate in the master mode outputs TRGO signal to control another timer which operate in the slave mode, TRGO include reset evevt, start evevt, update evevt, capture/compare pulse evevt, compare evevt. slave timer received the ITIx and performs the corresponding mode, include internal clock mode, quadrature decoder mode, restart mode, pause mode, event mode, external clock mode.

Figure 15-28. TIMER0 Master/Slave mode timer example shows the timer0 trigger selection when it is configured in slave mode.

Figure 15-28. TIMER0 Master/Slave mode timer example



Other interconnection examples:

■ TIMER2 as prescaler for TIMER0

We configure TIMER2 as a prescaler for TIMER0. Refer to ***Figure 15-28. TIMER0 Master/Slave mode timer example*** for connections. Do as follow:

1. Configure TIMER2 in master mode and select its update event (UPE) as trigger output (MMC=3'b010 in the TIMER2_CTL1 register). Then TIMER2 drives a periodic signal on each counter overflow.
2. Configure the TIMER2 period (TIMER2_CAR registers).
3. Select the TIMER0 input trigger source from TIMER2 (TRGS=3'b010 in the TIMERx_SMCFG register).
4. Configure TIMER0 in external clock mode 0 (SMC=3'b111 in TIMER0_SMCFG register).
5. Start TIMER0 by writing '1 in the CEN bit (TIMER0_CTL0 register).
6. Start TIMER2 by writing '1 in the CEN bit (TIMER2_CTL0 register).

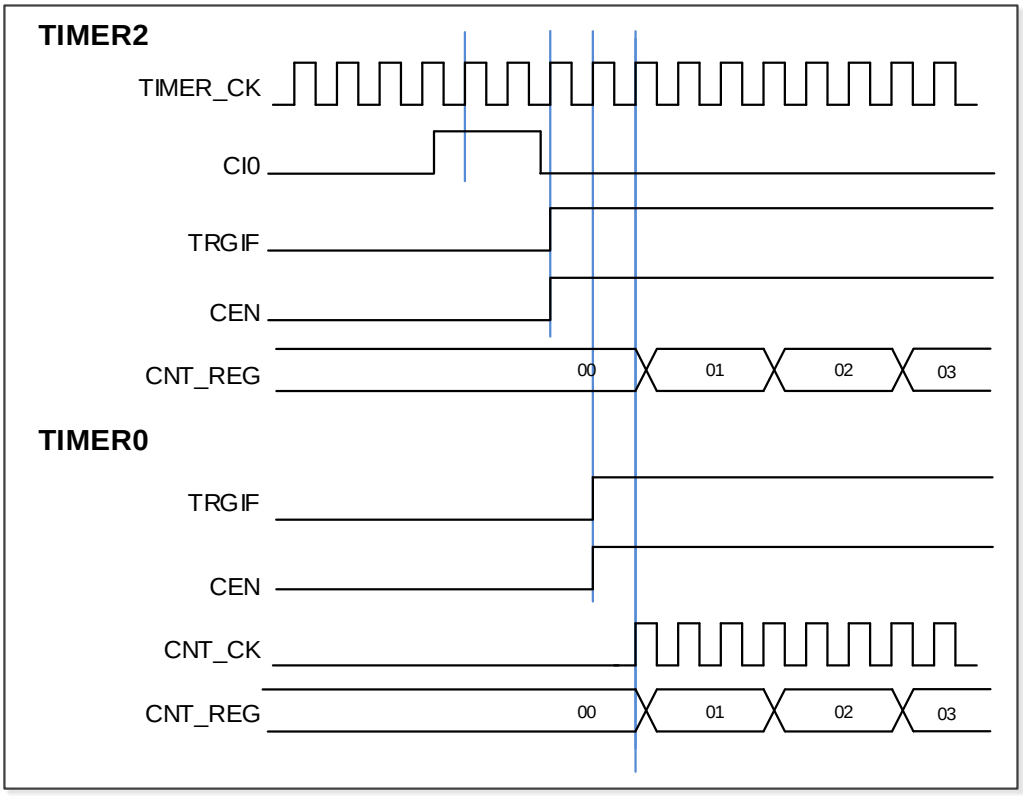
■ Using an external trigger to start 2 timers synchronously

We configure the start of TIMER0 triggered by the enable signal of TIMER2, and TIMER2 is triggered by its CI0 input rises edge. To ensure 2 timers start synchronously, TIMER2 must be configured in Master/Slave mode. Do as follow:

1. Configure TIMER2 in slave mode to get the input trigger from CI0 (TRGS=3'b100 in the TIMER2_SMCFG register).
2. Configure TIMER2 in event mode (SMC=3'b110 in the TIMER2_SMCFG register).
3. Configure the TIMER2 in Master/Slave mode by writing MSM=1 (TIMER2_SMCFG register).
4. Configure TIMER0 to get the input trigger from TIMER2 (TRGS=3'b010 in the TIMER0_SMCFG register).
5. Configure TIMER0 in event mode (SMC=3'b110 in the TIMER0_SMCFG register).

When a rising edge occurs on TIMER2's CI0, two timer's counters start counting synchronously on the internal clock and both TRGIF flags are set.

Figure 15-29. Triggering TIMER0 and TIMER2 with TIMER2's CI0 input



Timer DMA mode

Timer DMA mode is the function that configures timer's register by DMA module. The relative registers are TIMERx_DMACFG and TIMERx_DMATB. Corresponding DMA request bit should be asserted to enable DMA request for internal interrupt event. TIMERx will send a request to DMA when the interrupt event occurs. DMA is configured to M2P (memory to peripheral) mode and the address of TIMERx_DMATB is configured to PADDR (peripheral base address), then DMA will access the TIMERx_DMATB. In fact, TIMERx_DMATB register is only a buffer, timer will map the TIMERx_DMATB to an internal register, appointed by the field of DMATA in TIMERx_DMACFG. If the field of DMATC in TIMERx_DMACFG is 0 (1 transfer), the timer sends only one DMA request. While if TIMERx_DMATC is not 0, such as 3 (4 transfers), then timer will send 3 more requests to DMA, and DMA will access timer's registers DMATA+0x4, DMATA+0x8 and DMATA+0xC at the next 3 accesses to TIMERx_DMATB. In a word, one-time DMA internal interrupt event asserts, (DMATC+1) times request will be sent by TIMERx.

If one more DMA request event occurs, TIMERx will repeat the process above.

Timer debug mode

When the RISC-V core halted, and the TIMERx_HOLD configuration bit in DBG_CTL register is set to 1, the TIMERx counter stops.

15.1.5. TIMERx registers(x=0)

TIMER0 base address: 0x4001 2C00

Control register 0 (TIMERx_CTL0)

Address offset: 0x00
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved						CKDIV[1:0]		ARSE	CAM[1:0]		DIR	SPM	UPS	UPDIS	CEN
						rw		rw	rw		rw	rw	rw	rw	rw

Bits	Fields	Descriptions
15:10	Reserved	Must be kept at reset value
9:8	CKDIV[1:0]	Clock division The CKDIV bits can be configured by software to specify division factor between the CK_TIMER and the dead-time and digital filter sample clock (DTS). 00: $f_{DTS}=f_{CK\_TIMER}$ 01: $f_{DTS}= f_{CK\_TIMER} /2$ 10: $f_{DTS}= f_{CK\_TIMER} /4$ 11: Reserved
7	ARSE	Auto-reload shadow enable 0: The shadow register for TIMERx_CAR register is disabled 1: The shadow register for TIMERx_CAR register is enabled
6:5	CAM[1:0]	Counter aligns mode selection 00: No center-aligned mode (edge-aligned mode). The direction of the counter is specified by the DIR bit. 01: Center-aligned and counting down assert mode. The counter counts under center-aligned and channel is configured in output mode (CHxMS=00 in TIMERx_CHCTL0 register). Only when counting down, CHxF bit can be set. 10: Center-aligned and counting up assert mode. The counter counts under center-aligned and channel is configured in output mode (CHxMS=00 in TIMERx_CHCTL0 register). Only when counting up, CHxF bit can be set. 11: Center-aligned and counting up/down assert mode. The counter counts under center-aligned and channel is configured in output mode (CHxMS=00 in TIMERx_CHCTL0 register). Both when counting up and counting down, CHxF bit can be set. After the counter is enabled, cannot be switched from 0x00 to non 0x00.
4	DIR	Direction

0: Count up
1: Count down
If the timer work in center-aligned mode or quadrature decoder mode, this bit is read only.

3	SPM	Single pulse mode. 0: Single pulse mode disable. The counter continues after update event. 1: Single pulse mode enable. The counter counts until the next update event occurs.
2	UPS	Update source This bit is used to select the update event sources by software. 0: These events generate update interrupts or DMA requests: The UPG bit is set The counter generates an overflow or underflow event The restart mode generates an update event. 1: This event generates update interrupts or DMA requests: The counter generates an overflow or underflow event
1	UPDIS	Update disable. This bit is used to enable or disable the update event generation. 0: Update event enable. When an update event occurs, the corresponding shadow registers are loaded with their preloaded values. These events generate update event: The UPG bit is set The counter generates an overflow or underflow event The restart mode generates an update event. 1: Update event disable. **Note:** When this bit is set to 1, setting UPG bit or the restart mode does not generate an update event, but the counter and prescaler are initialized.
0	CEN	Counter enable 0: Counter disable 1: Counter enable The CEN bit must be set by software when timer works in external clock, pause mode and quadrature decoder mode.

Control register 1 (TIMERx_CTL1)

Address offset: 0x04
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved	ISO3	ISO2N	ISO2	ISO1N	ISO1	ISO0N	ISO0	TI0S	MMC[2:0]			DMAS	CCUC	Reserved	CCSE

Bits	Fields	Descriptions
15	Reserved	Must be kept at reset value
14	ISO3	Idle state of channel 3 output Refer to ISO0 bit
13	ISO2N	Idle state of channel 2 complementary output Refer to ISO0N bit
12	ISO2	Idle state of channel 2 output Refer to ISO0 bit
11	ISO1N	Idle state of channel 1 complementary output Refer to ISO0N bit
10	ISO1	Idle state of channel 1 output Refer to ISO0 bit
9	ISO0N	Idle state of channel 0 complementary output 0: When POEN bit is reset, CH0_ON is set low. 1: When POEN bit is reset, CH0_ON is set high This bit can be modified only when PROT [1:0] bits in TIMERx_CCHP register is 00.
8	ISO0	Idle state of channel 0 output 0: When POEN bit is reset, CH0_O is set low. 1: When POEN bit is reset, CH0_O is set high The CH0_O output changes after a dead-time if CH0_ON is implemented. This bit can be modified only when PROT [1:0] bits in TIMERx_CCHP register is 00.
7	TI0S	Channel 0 trigger input selection 0: The TIMERx_CH0 pin input is selected as channel 0 trigger input. 1: The result of combinational XOR of TIMERx_CH0, CH1 and CH2 pins is selected as channel 0 trigger input.
6:4	MMC[2:0]	Master mode control These bits control the selection of TRGO signal, which is sent in master mode to slave timers for synchronization function. 000: When a counter reset event occurs, a TRGO trigger signal is output. The counter resert source: Master timer generate a reset the UPG bit in the TIMERx_SWEVG register is set 001: Enable. When a conter start event occurs, a TRGO trigger signal is output. The counter start source : CEN control bit is set The trigger input in pause mode is high 010: When an update event occurs, a TRGO trigger signal is output. The update source depends on UPDIS bit and UPS bit.

		011: When a capture or compare pulse event occurs in channel0, a TRGO trigger signal is output. 100: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O0CPRE. 101: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O1CPRE. 110: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O2CPRE. 111: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O3CPRE.
3	DMAS	DMA request source selection 0: When capture or compare event occurs, the DMA request of channel x is sent 1: When update event occurs, the DMA request of channel x is sent.
2	CCUC	Commutation control shadow register update control When the commutation control shadow enable (for CHxEN, CHxNEN and CHxCOMCTL bits) are set (CCSE=1), these shadow registers update are controlled as below: 0: The shadow registers update by when CMTG bit is set. 1: The shadow registers update by when CMTG bit is set or a rising edge of TRGI occurs. When a channel does not have a complementary output, this bit has no effect.
1	Reserved	Must be kept at reset value.
0	CCSE	Commutation control shadow enable 0: The shadow registers for CHxEN, CHxNEN and CHxCOMCTL bits are disabled. 1: The shadow registers for CHxEN, CHxNEN and CHxCOMCTL bits are enabled. After these bits have been written, they are updated based when commutation event coming. When a channel does not have a complementary output, this bit has no effect.

Slave mode configuration register (TIMERx_SMCFG)

Address offset: 0x08
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															
rw

rw	rw	rw		rw				rw	rw				rw		

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15	ETP	External trigger polarity This bit specifies the polarity of ETI signal 0: ETI is active at rising edge or high level . 1: ETI is active at falling edge or low level .
14	SMC1	Part of SMC for enable External clock mode1. In external clock mode 1, the counter is clocked by any active edge on the ETIFP signal. 0: External clock mode 1 disabled 1: External clock mode 1 enabled. When the slave mode is configured as restart mode, pause mode or event mode, the timer can still work in the external clock 1 mode by setting this bit. But the TRGS bits must not be 3'b111 in this case. The clock source of the timer will be ETIFP if external clock mode 0 and external clock mode 1 are configured at the same time. **Note:** External clock mode 0 enable is in this register's SMC[2:0] bit-filed.
13:12	ETPSC[1:0]	The prescaler of external trigger The frequency of external trigger signal ETIFP must not be at higher than 1/4 of TIMER_CK frequency. When the external trigger signal is a fast clock, the prescaler can be enabled to reduce ETIFP frequency. 00: Prescaler disable. 01: The prescaler is 2. 10: The prescaler is 4. 11: The prescaler is 8.
11:8	ETFC[3:0]	External trigger filter control The external trigger can be filtered by digital filter and this bit-field configure the filtering capability. Basic principle of digital filter: continuously sample the external trigger signal according to f_{SAMP} and record the number of times of the same level of the signal. After reaching the filtering capacity configured by this bit-field, it is considered to be an effective level. The filtering capability configuration is as follows:

EXTFC[3:0]	Times	f_{SAMP}
4'b0000	Filter disabled.	
4'b0001	2	f_{TIMER_CK}
4'b0010	4	
4'b0011	8	
4'b0100	6	$f_{DTS\_CK}/2$
4'b0101	8	
4'b0110	6	$f_{DTS\_CK}/4$

		4’b0111	8	
		4’b1000	6	$f_{DTS\_CK}/8$
		4’b1001	8	
		4’b1010	5	$f_{DTS\_CK}/16$
		4’b1011	6	
		4’b1100	8	
		4’b1101	5	$f_{DTS\_CK}/32$
		4’b1110	6	
		4’b1111	8	

7	MSM	Master-slave mode This bit can be used to synchronize selected timers to begin counting at the same time. The TRGI is used as the start event, and through TRGO, timers are connected together. 0: Master-slave mode disable 1: Master-slave mode enable
6:4	TRGS[2:0]	Trigger selection This bit-field specifies which signal is selected as the trigger input, which is used to synchronize the counter. 000: ITI0 001: ITI1 010: ITI2 011: ITI3 100: CI0F_ED 101: CI0FE0 110: CI1FE1 111: ETIFP These bits must not be changed when slave mode is enabled.
3	Reserved	Must be kept at reset value.
2:0	SMC[2:0]	Slave mode control 000: Disable mode. The slave mode is disabled; The prescaler is clocked directly by the internal clock (TIMER_CK) when CEN bit is set high. 001: Quadrature decoder mode 0.The counter counts on CI0FE0 edge, while the direction depends on CI1FE1 level. 010: Quadrature decoder mode 1.The counter counts on CI1FE1 edge, while the direction depends on CI0FE0 level. 011: Quadrature decoder mode 2.The counter counts on both CI0FE0 and CI1FE1 edge, while the direction depends on each other. 100: Restart mode. The counter is reinitialized and an update event is generated on the rising edge of the selected trigger input. 101: Pause mode. The trigger input enables the counter clock when it is high and disables the counter clock when it is low. 110: Event mode. A rising edge of the trigger input enables the counter.

111: External clock mode 0. The counter counts on the rising edges of the selected trigger.

DMA and interrupt enable register (TIMERx_DMAINTEN)

Address offset: 0x0C
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Interrupt flag register (TIMERx_INTF)

Address offset: 0x10

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved			CH3OF	CH2OF	CH1OF	CH0OF	Reserved	BRKIF	TRGIF	CMTIF	CH3IF	CH2IF	CH1IF	CH0IF	UPIF
			rc_w0	rc_w0	rc_w0	rc_w0		rc_w0	rc_w0	rc_w0	rc_w0	rc_w0	rc_w0	rc_w0	rc_w0

Bits	Fields	Descriptions
15:13	Reserved	Must be kept at reset value.
12	CH3OF	Channel 3 over capture flag Refer to CH0OF description
11	CH2OF	Channel 2 over capture flag Refer to CH0OF description
10	CH1OF	Channel 1 over capture flag

		Refer to CH0OF description
9	CH0OF	Channel 0 over capture flag When channel 0 is configured in input mode, this flag is set by hardware when a capture event occurs while CH0IF flag has already been set. This flag is cleared by software. 0: No over capture interrupt occurred 1: Over capture interrupt occurred
8	Reserved	Must be kept at reset value.
7	BRKIF	Break interrupt flag When the break input is inactive, the bit is set by hardware. When the break input is inactive, the bit can be cleared by software. 0: No active level break has been detected. 1: An active level has been detected.
6	TRGIF	Trigger interrupt flag This flag is set on trigger event and cleared by software. When in pause mode, both edges on trigger input generates a trigger event, otherwise, only an active edge on trigger input can generates a trigger event. 0: No trigger event occurred. 1: Trigger interrupt occurred.
5	CMTIF	Channel commutation interrupt flag This flag is set by hardware when channel's commutation event occurs, and cleared by software 0: No channel commutation interrupt occurred 1: Channel commutation interrupt occurred
4	CH3IF	Channel 3 's capture/compare interrupt flag Refer to CH0IF description
3	CH2IF	Channel 2 's capture/compare interrupt flag Refer to CH0IF description
2	CH1IF	Channel 1 's capture/compare interrupt flag Refer to CH0IF description
1	CH0IF	Channel 0 's capture/compare interrupt flag This flag is set by hardware and cleared by software. When channel 0 is in input mode, this flag is set when a capture event occurs. When channel 0 is in output mode, this flag is set when a compare event occurs. If Channel0 is set to input mode, this bit will be reset by reading TIMERx_CH0CV. 0: No Channel 0 interrupt occurred 1: Channel 0 interrupt occurred
0	UPIF	Update interrupt flag

This bit is set by hardware on an update event and cleared by software.
0: No update interrupt occurred
1: Update interrupt occurred

Software event generation register (TIMERx_SWEVG)

Address offset: 0x14
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								BRKG	TRGG	CMTG	CH3G	CH2G	CH1G	CH0G	UPG
								w	w	w	w	w	w	w	w

Bits	Fields	Descriptions
15:8	Reserved	Must be kept at reset value.
7	BRKG	Break event generation This bit is set by software and cleared by hardware automatically. When this bit is set, the POEN bit is cleared and BRKIF flag is set, related interrupt or DMA transfer can occur if enabled. 0: No generate a break event 1: Generate a break event
6	TRGG	Trigger event generation This bit is set by software and cleared by hardware automatically. When this bit is set, the TRGIF flag in TIMERx_INTF register is set, related interrupt or DMA transfer can occur if enabled. 0: No generate a trigger event 1: Generate a trigger event
5	CMTG	Channel commutation event generation This bit is set by software and cleared by hardware automatically. When this bit is set, channel's capture/compare control registers (CHxEN, CHxNEN and CHxCOMCTL bits) are updated based on the value of CCSE (in the TIMERx_CTL1). 0: No affect 1: Generate channel's c/c control update event
4	CH3G	Channel 3's capture or compare event generation Refer to CH0G description
3	CH2G	Channel 2's capture or compare event generation Refer to CH0G description
2	CH1G	Channel 1's capture or compare event generation

		Refer to CH0G description
1	CH0G	Channel 0's capture or compare event generation This bit is set by software in order to generate a capture or compare event in channel 0, it is automatically cleared by hardware. When this bit is set, the CH0IF flag is set, the corresponding interrupt or DMA request is sent if enabled. In addition, if channel 1 is configured in input mode, the current value of the counter is captured in TIMERx_CH0CV register, and the CH0OF flag is set if the CH0IF flag was already high. 0: No generate a channel 1 capture or compare event 1: Generate a channel 1 capture or compare event
0	UPG	Update event generation This bit can be set by software, and cleared by hardware automatically. When this bit is set, the counter is cleared if the center-aligned or up counting mode is selected, else (down counting) it takes the auto-reload value. The prescaler counter is cleared at the same time. 0: No generate an update event 1: Generate an update event

Channel control register 0 (TIMERx_CHCTL0)

Address offset: 0x18

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw				rw		rw		rw				rw		rw	

Output compare mode:

Bits	Fields	Descriptions
15	CH1COMCEN	Channel 1 output compare clear enable Refer to CH0COMCEN description
14:12	CH1COMCTL[2:0]	Channel 1 compare output control Refer to CH0COMCTL description
11	CH1COMSEN	Channel 1 output compare shadow enable Refer to CH0COMSEN description
10	CH1COMFEN	Channel 1 output compare fast enable Refer to CH0COMFEN description
9:8	CH1MS[1:0]	Channel 1 mode selection

This bit-field specifies the direction of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH1EN bit in TIMERx_CHCTL2 register is reset).
00: Channel 1 is programmed as output mode
01: Channel 1 is programmed as input mode, IS1 is connected to CI1FE1
10: Channel 1 is programmed as input mode, IS1 is connected to CI0FE1
11: Channel 1 is programmed as input mode, IS1 is connected to ITS.
Note: When CH1MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.

7	CH0COMCEN	Channel 0 output compare clear enable. When this bit is set, if the ETIFP signal is detected as high level, the O0CPRE signal will be cleared. 0: Channel 0 output compare clear disable 1: Channel 0 output compare clear enable
6:4	CH0COMCTL[2:0]	Channel 0 compare output control This bit-field specifies the compare output mode of the the output prepare signal O0CPRE. In addition, the high level of O0CPRE is the active level, and CH0_O and CH0_ON channels polarity depends on CH0P and CH0NP bits. 000: Timing mode. The O0CPRE signal keeps stable, independent of the comparison between the register TIMERx_CH0CV and the counter TIMERx_CNT. 001: Set the channel output. O0CPRE signal is forced high when the counter is equals to the output compare register TIMERx_CH0CV. 010: Clear the channel output. O0CPRE signal is forced low when the counter is equals to the output compare register TIMERx_CH0CV. 011: Toggle on match. O0CPRE toggles when the counter is equals to the output compare register TIMERx_CH0CV. 100: Force low. O0CPRE is forced to low level. 101: Force high. O0CPRE is forced to high level. 110: PWM mode0. When counting up, O0CPRE is high when the counter is smaller than TIMERx_CH0CV, and low otherwise. When counting down, O0CPRE is low when the counter is larger than TIMERx_CH0CV, and high otherwise. 111: PWM mode1. When counting up, O0CPRE is low when the counter is smaller than TIMERx_CH0CV, and high otherwise. When counting down, O0CPRE is high when the counter is larger than TIMERx_CH0CV, and low otherwise. If configured in PWM mode, the O0CPRE level changes only when the output compare mode is adjusted from “Timing” mode to “PWM” mode or the comparison result changes. This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 11 and CH0MS bit-filed is 00(COMPARE MODE).
3	CH0COMSEN	Channel 0 compare output shadow enable When this bit is set, the shadow register of TIMERx_CH0CV register, which updates at each update event, will be enabled.

		0: Channel 0 output compare shadow disable 1: Channel 0 output compare shadow enable The PWM mode can be used without verifying the shadow register only in single pulse mode (when SPM=1) This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 11 and CH0MS bit-filed is 00.
2	CH0COMFEN	Channel 0 output compare fast enable When this bit is set, the effect of an event on the trigger in input on the capture/compare output will be accelerated if the channel is configured in PWM0 or PWM1 mode. The output channel will treat an active edge on the trigger input as a compare match, and CH0_O is set to the compare level independently from the result of the comparison. 0: Channel 0 output quickly compare disable. 1: Channel 0 output quickly compare enable.
1:0	CH0MS[1:0]	Channel 0 I/O mode selection This bit-field specifies the work mode of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH0EN bit in TIMERx_CHCTL2 register is reset).). 00: Channel 0 is programmed as output mode 01: Channel 0 is programmed as input mode, IS0 is connected to CI0FE0 10: Channel 0 is programmed as input mode, IS0 is connected to CI1FE0 11: Channel 0 is programmed as input mode, IS0 is connected to ITS **Note:** When CH0MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.

Input capture mode:

Bits	Fields	Descriptions
15:12	CH1CAPFLT[3:0]	Channel 1 input capture filter control Refer to CH0CAPFLT description
11:10	CH1CAPPSC[1:0]	Channel 1 input capture prescaler Refer to CH0CAPPSC description
9:8	CH1MS[1:0]	Channel 1 mode selection Same as Output compare mode
7:4	CH0CAPFLT[3:0]	Channel 0 input capture filter control The CI0 input signal can be filtered by digital filter and this bit-field configure the filtering capability. Basic principle of digital filter: continuously sample the CI0 input signal according to f_{SAMP} and record the number of times of the same level of the signal. After reaching the filtering capacity configured by this bit, it is considered to be an effective level. The filtering capability configuration is as follows:

CH0CAPFLT [3:0]	Times	f_{SAMP}
4'b0000	Filter disabled.	
4'b0001	2	f_{CK_TIMER}
4'b0010	4	
4'b0011	8	
4'b0100	6	$f_{DTS}/2$
4'b0101	8	
4'b0110	6	$f_{DTS}/4$
4'b0111	8	
4'b1000	6	$f_{DTS}/8$
4'b1001	8	
4'b1010	5	$f_{DTS}/16$
4'b1011	6	
4'b1100	8	
4'b1101	5	$f_{DTS}/32$
4'b1110	6	
4'b1111	8	

3:2 CH0CAPPSC[1:0] Channel 0 input capture prescaler

This bit-field specifies the factor of the prescaler on channel 0 input. The prescaler is reset when CH0EN bit in TIMERx_CHCTL2 register is clear.

00: Prescaler disable, input capture occurs on every channel input edge

01: The input capture occurs on every 2 channel input edges

10: The input capture occurs on every 4 channel input edges

11: The input capture occurs on every 8 channel input edges

1:0 CH0MS[1:0] Channel 0 mode selection

Same as Output compare mode

Channel control register 1 (TIMERx_CHCTL1)

Address offset: 0x1C

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

11	CH3COMSEN	Channel 3 output compare shadow enable Refer to CH0COMSEN description
10	CH3COMFEN	Channel 3 output compare fast enable Refer to CH0COMFEN description
9:8	CH3MS[1:0]	Channel 3 mode selection This bit-field specifies the direction of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH3EN bit in TIMERx_CHCTL2 register is reset). 00: Channel 3 is programmed as output mode 01: Channel 3 is programmed as input mode, IS3 is connected to CI3FE3 10: Channel 3 is programmed as input mode, IS3 is connected to CI2FE3 11: Channel 3 is programmed as input mode, IS3 is connected to ITS. **Note:** When CH3MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.
7	CH2COMCEN	Channel 2 output compare clear enable. When this bit is set, if the ETIFP signal is detected as high level, the O2CPRE signal will be cleared. 0: Channel 2 output compare clear disable 1: Channel 2 output compare clear enable
6:4	CH2COMCTL[2:0]	Channel 2 compare output control This bit-field specifies the compare output mode of the the output prepare signal O0CPRE. In addition, the high level of O0CPRE is the active level, and CH0_O and CH0_ON channels polarity depends on CH0P and CH0NP bits. 000: Timing mode. The O2CPRE signal keeps stable, independent of the comparison between the output compare register TIMERx_CH2CV and the counter TIMERx_CNT. 001: Set the channel output. O2CPRE signal is forced high when the counter is equals to the output compare register TIMERx_CH2CV. 010: Clear the channel output. O2CPRE signal is forced low when the counter is equals to the output compare register TIMERx_CH2CV. 011: Toggle on match. O2CPRE toggles when the counter is equals to the output compare register TIMERx_CH2CV. 100: Force low. O2CPRE is forced to low level. 101: Force high. O2CPRE is forced to high level. 110: PWM mode 0. When counting up, O2CPRE is high when the counter is smaller than TIMERx_CH2CV, and low otherwise. When counting down, O2CPRE is low when the counter is larger than TIMERx_CH2CV, and high otherwise.

		111: PWM mode 1. When counting up, O2CPRE is low when the counter is smaller than TIMERx_CH2CV, and high otherwise. When counting down, O2CPRE is high when the counter is larger than TIMERx_CH2CV, and low otherwise. If configured in PWM mode, the O2CPRE level changes only when the output compare mode is adjusted from “Timing” mode to “PWM” mode or the comparison result changes. This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 11 and CH2MS bit-filed is 00(COMPARE MODE).
3	CH2COMSEN	Channel 2 compare output shadow enable When this bit is set, the shadow register of TIMERx_CH2CV register, which updates at each update event will be enabled. 0: Channel 2 output compare shadow disable 1: Channel 2 output compare shadow enable The PWM mode can be used without verifying the shadow register only in single pulse mode (when SPM=1) This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 11 and CH0MS bit-filed is 00.
2	CH2COMFEN	Channel 2 output compare fast enable When this bit is set, the effect of an event on the trigger in input on the capture/compare output will be accelerated if the channel is configured in PWM1 or PWM2 mode. The output channel will treat an active edge on the trigger input as a compare match, and CH2_O is set to the compare level independently from the result of the comparison. 0: Channel 2 output quickly compare disable. 1: Channel 2 output quickly compare enable.
1:0	CH2MS[1:0]	Channel 2 I/O mode selection This bit-field specifies the work mode of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH2EN bit in TIMERx_CHCTL2 register is reset).). 00: Channel 2 is programmed as output mode 01: Channel 2 is programmed as input mode, IS2 is connected to CI2FE2 10: Channel 2 is programmed as input mode, IS2 is connected to CI3FE2 11: Channel 2 is programmed as input mode, IS2 is connected to ITS. **Note:** When CH2MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.

Input capture mode:

Bits	Fields	Descriptions
15:12	CH3CAPFLT[3:0]	Channel 3 input capture filter control Refer to CH0CAPFLT description
11:10	CH3CAPPSC[1:0]	Channel 3 input capture prescaler

Refer to CH0CAPPSC description

9:8 CH3MS[1:0] Channel 3 mode selection

Same as Output compare mode

7:4 CH2CAPFLT[3:0] Channel 2 input capture filter control

The CI2 input signal can be filtered by digital filter and this bit-field configure the filtering capability.

Basic principle of digital filter: continuously sample the CI2 input signal according to f_{SAMP} and record the number of times of the same level of the signal. After reaching the filtering capacity configured by this bit, it is considered to be an effective level.

The filtering capability configuration is as follows:

CH2CAPFLT [3:0]	Times	f_{SAMP}
4'b0000	Filter disabled.	
4'b0001	2	f_{CK_TIMER}
4'b0010	4	
4'b0011	8	
4'b0100	6	$f_{DTS}/2$
4'b0101	8	
4'b0110	6	$f_{DTS}/4$
4'b0111	8	
4'b1000	6	$f_{DTS}/8$
4'b1001	8	
4'b1010	5	$f_{DTS}/16$
4'b1011	6	
4'b1100	8	
4'b1101	5	$f_{DTS}/32$
4'b1110	6	
4'b1111	8	

3:2 CH2CAPPSC[1:0] Channel 2 input capture prescaler

This bit-field specifies the factor of the prescaler on channel 2 input. The prescaler is reset when CH2EN bit in TIMERx_CHCTL2 register is clear.

00: Prescaler disable, input capture occurs on every channel input edge

01: The input capture occurs on every 2 channel input edges

10: The input capture occurs on every 4 channel input edges

11: The input capture occurs on every 8 channel input edges

1:0 CH2MS[1:0] Channel 2 mode selection

Same as Output compare mode

Channel control register 2 (TIMERx_CHCTL2)

Address offset: 0x20

Reset value: 0x0000

This register can be accessed by half-word(16-bit) or word(32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

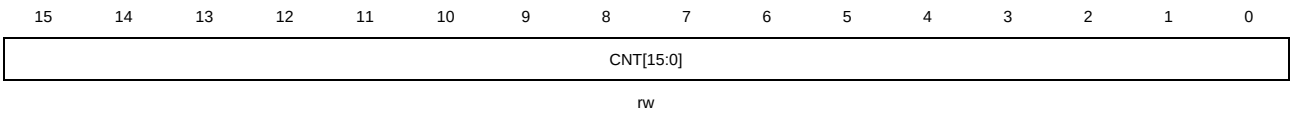
Bits	Fields	Descriptions
15:14	Reserved	Must be kept at reset value
13	CH3P	Channel 3 capture/compare function polarity Refer to CH0P description
12	CH3EN	Channel 3 capture/compare function enable Refer to CH0EN description
11	CH2NP	Channel 2 complementary output polarity Refer to CH0NP description
10	CH2NEN	Channel 2 complementary output enable Refer to CH0NEN description
9	CH2P	Channel 2 capture/compare function polarity Refer to CH0P description
8	CH2EN	Channel 2 capture/compare function enable Refer to CH0EN description
7	CH1NP	Channel 1 complementary output polarity Refer to CH0NP description
6	CH1NEN	Channel 1 complementary output enable Refer to CH0NEN description
5	CH1P	Channel 1 capture/compare function polarity Refer to CH0P description
4	CH1EN	Channel 1 capture/compare function enable Refer to CH0EN description
3	CH0NP	Channel 0 complementary output polarity When channel 0 is configured in output mode, this bit specifies the complementary output signal polarity. 0: Channel 0 complementary output high level is active level 1: Channel 0 complementary output low level is active level This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 11 or 10 and CH0MS [1:0] bit-filed in TIMERx_CHCTL0 register is 00.
2	CH0NEN	Channel 0 complementary output enable When channel 0 is configured in output mode, setting this bit enables the complementary output in channel0.

		0: Channel 0 complementary output disabled 1: Channel 0 complementary output enabled
1	CH0P	Channel 0 capture/compare function polarity When channel 0 is configured in output mode, this bit specifies the output signal polarity. 0: Channel 0 high level is active level 1: Channel 0 low level is active level When channel 0 is configured in input mode, this bit specifies the IS0 signal polarity. 0: Rising edge: the rising edge of IS0 is captured. When used as extern trigger, IS0 is non-inverted. 1: Falling edge: the falling edge of IS0 is captured. When used as extern trigger, IS0 is inverted. This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 11 or 10.
0	CH0EN	Channel 0 capture/compare function enable When channel 0 is configured in output mode, setting this bit enables CH0_O signal in active state. When channel 0 is configured in input mode, setting this bit enables the capture event in channel0. 0: Channel 0 disabled 1: Channel 0 enabled

Counter register (TIMERx_CNT)

Address offset: 0x24
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)



Bits	Fields	Descriptions
15:0	CNT[15:0]	This bit-filed indicates the current counter value. Writing to this bit-filed can change the value of the counter.

Prescaler register (TIMERx_PSC)

Address offset: 0x28
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

PSC[15:0]

rw

Bits	Fields	Descriptions
15:0	PSC[15:0]	Prescaler value of the counter clock The TIMER_CK clock is divided by (PSC+1) to generate the counter clock. The value of this bit-filed will be loaded to the corresponding shadow register at every update event.

Counter auto reload register (TIMERx_CAR)

Address offset: 0x2C
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CARL[15:0]															
rw															

Bits	Fields	Descriptions
15:0	CARL[15:0]	Counter auto reload value This bit-filed specifies the auto reload value of the counter. Note: When the timer is configured in input capture mode, this register must be configured a non-zero value (such as 0xFFFF) which is larger than user expected value.

Counter repetition register (TIMERx_CREP)

Address offset: 0x30
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								CREP[7:0]							
								rw							

Bits	Fields	Descriptions
15:8	Reserved	Must be kept at reset value.
7:0	CREP[7:0]	Counter repetition value This bit-filed specifies the update event generation rate. Each time the repetition counter counting down to zero, an update event is generated. The update rate of the shadow registers is also affected by this bit-filed when these shadow registers

are enabled.

Channel 0 capture/compare value register (TIMERx_CH0CV)

Address offset: 0x34
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH0VAL[15:0]															
rw															

Bits	Fields	Descriptions
15:0	CH0VAL[15:0]	Capture or compare value of channel0 When channel 0 is configured in input mode, this bit-filed indicates the counter value corresponding to the last capture event. And this bit-filed is read-only. When channel 0 is configured in output mode, this bit-filed contains value to be compared to the counter. When the corresponding shadow register is enabled, the shadow register updates every update event.

Channel 1 capture/compare value register (TIMERx_CH1CV)

Address offset: 0x38
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH1VAL[15:0]															
rw															

Bits	Fields	Descriptions
15:0	CH1VAL[15:0]	Capture or compare value of channel1 When channel 1 is configured in input mode, this bit-filed indicates the counter value corresponding to the last capture event. And this bit-filed is read-only. When channel 1 is configured in output mode, this bit-filed contains value to be compared to the counter. When the corresponding shadow register is enabled, the shadow register updates every update event.

Channel 2 capture/compare value register (TIMERx_CH2CV)

Address offset: 0x3C
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH2VAL[15:0]															
rw															

Bits	Fields	Descriptions
15:0	CH2VAL[15:0]	Capture or compare value of channel 2 When channel 2 is configured in input mode, this bit-filed indicates the counter value corresponding to the last capture event. And this bit-filed is read-only. When channel 2 is configured in output mode, this bit-filed contains value to be compared to the counter. When the corresponding shadow register is enabled, the shadow register updates every update event.

Channel 3 capture/compare value register (TIMERx_CH3CV)

Address offset: 0x40

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH3VAL[15:0]															
rw															

Bits	Fields	Descriptions
15:0	CH3VAL[15:0]	Capture or compare value of channel 3 When channel3 is configured in input mode, this bit-filed indicates the counter value corresponding to the last capture event. And this bit-filed is read-only. When channel 3 is configured in output mode, this bit-filed contains value to be compared to the counter. When the corresponding shadow register is enabled, the shadow register updates every update event.

Complementary channel protection register (TIMERx_CCHP)

Address offset: 0x44

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw		rw							

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15	POEN	Primary output enable The bit can be set to 1 by: - Write 1 to this bit - If OAEN is set to 1, this bit is set to 1 at the next update event. The bit can be cleared to 0 by: - Write 0 to this bit - Valid fault input (asynchronous). When one of channels is configured in output mode, setting this bit enables the channel outputs (CHx_O and CHx_ON) if the corresponding enable bits (CHxEN, CHxNEN in TIMERx_CHCTL2 register) have been set. 0: Disable channel outputs (CHxO or CHxON). 1: Enabled channel outputs (CHxO or CHxON). **Note:** This bit is only valid when CHxMS=2'b00.
14	OAEN	Output automatic enable 0: The POEN bit can only be set by software. 1: POEN can be set at the next update event, if the break input is not active. This bit can be modified only when PROT [1:0] bit-filed in TIMERx_CCHP register is 00.
13	BRKP	Break input polarity This bit specifies the polarity of the BRKIN input signal. 0: BRKIN input active low 1; BRKIN input active high
12	BRKEN	Break input enable This bit can be set to enable the BRKIN and CKM clock failure event inputs. 0: Break inputs disabled 1; Break inputs enabled This bit can be modified only when PROT [1:0] bit-filed in TIMERx_CCHP register is 00.
11	ROS	Run mode "off-state" enable When POEN bit is set (Run mode), this bit can be set to enable the "off-state" for the channels which has been configured in output mode. Please refer to ***Table 15-2. Complementary outputs controlled by parameters*** 0: "off-state" disabled. If the CHxEN or CHxNEN bit is reset, the corresponding channel is output disabled. 1: "off-state" enabled. If the CHxEN or CHxNEN bit is reset, the corresponding channel is "off-state". This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 10 or 11.

10 IOS

Idle mode “off-state” enable

When POEN bit is reset (Idle mode), this bit can be set to enable the “off-state” for the channels which has been configured in output mode. Please refer to ***Table 15-2. Complementary outputs controlled by parameters***

0: “off-state” disabled. If the CHxEN/CHxNEN bits are both reset, the channels are output disabled.

1: “off-state” enabled. No matter the CHxEN/CHxNEN bits, the channels are “off-state”.

This bit cannot be modified when PROT [1:0] bit-filed in TIMERx_CCHP register is 10 or 11.

9:8 PROT[1:0]

Complementary register protect control

This bit-filed specifies the write protection property of registers.

00: protect disable. No write protection.

01: PROT mode 0.The ISOx/ISOxN bits in TIMERx_CTL1 register and the BRKEN/BRKP/OAEN/DTCFG bits in TIMERx_CCHP register are writing protected.

10: PROT mode 1. In addition of the registers in PROT mode 0, the CHxP/CHxNP bits in TIMERx_CHCTL2 register (if related channel is configured in output mode) and the ROS/IOS bits in TIMERx_CCHP register are writing protected.

11: PROT mode 2. In addition of the registers in PROT mode 1, the CHxCOMCTL/ CHxCOMSEN bits in TIMERx_CHCTL0/1 registers (if the related channel is configured in output) are writing protected.

This bit-field can be written only once after the reset. Once the TIMERx_CCHP register has been written, this bit-field will be writing protected.

7:0 DTCFG[7:0]

Dead time configure

The relationship between DTVAL value and the duration of dead-time is as follow:

DTCFG[7:5]	The duration of dead-time
3’b0xx	DTCFG[7:0] * t_{DTS_CK}
3’b10x	(64+ DTCFG[5:0]) * t_{DTS_CK} *2
3’b110	(32+ DTCFG[4:0]) * t_{DTS_CK} *8
3’b111	(32+ DTCFG[4:0]) * t_{DTS_CK} *16

Note:

1. t_{DTS_CK} is the period of DTS_CK which is configured by CKDIV[1:0] in TIMERx_CTL0.
2. This bit can be modified only when PROT [1:0] bit-filed in TIMERx_CCHP register is 00.

DMA configuration register (TIMERx_DMACFG)

Address offset: 0x48

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved			DMATC[4:0]					Reserved			DMATA [4:0]				
			rw								rw				

Bits	Fields	Descriptions
15:13	Reserved	Must be kept at reset value.
12:8	DMATC [4:0]	DMA transfer count This filed defines the number(n) of the register that DMA will access(R/W), n = (DMATC [4:0] +1). DMATC [4:0] is from 5'b0_0000 to 5'b1_0001.
7:5	Reserved	Must be kept at reset value.
4:0	DMATA [4:0]	DMA transfer access start address This filed define the first address for the DMA access the TIMERx_DMATB. When access is done through the TIMERx_DMA address first time, this bit-field specifies the address you just access. And then the second access to the TIMERx_DMATB, you will access the address of start address + 0x4.

DMA transfer buffer register (TIMERx_DMATB)

Address offset: 0x4C
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMATB[15:0]															
rw															

Bits	Fields	Descriptions
15:0	DMATB[15:0]	DMA transfer buffer When a read or write operation is assigned to this register, the register located at the address range (Start Addr + Transfer Timer* 4) will be accessed. The transfer Timer is calculated by hardware, and ranges from 0 to DMATC.

15.2. General level0 timer (TIMERx, x=1, 2, 3, 4)

15.2.1. Overview

The general level0 timer module (TIMER1, 2, 3, 4) is a four-channel timer that supports input capture and output compare. They can generate PWM signals to control motor or be used for power management applications. The general level0 time reference is a 16-bit counter that can be used as an unsigned counter.

In addition, the general level0 timers can be programmed and be used to count or time external events that drive other timers.

Timer are completely independent with each other, but there may be synchronized to provide a larger timer with their counters value incrementing in unison.

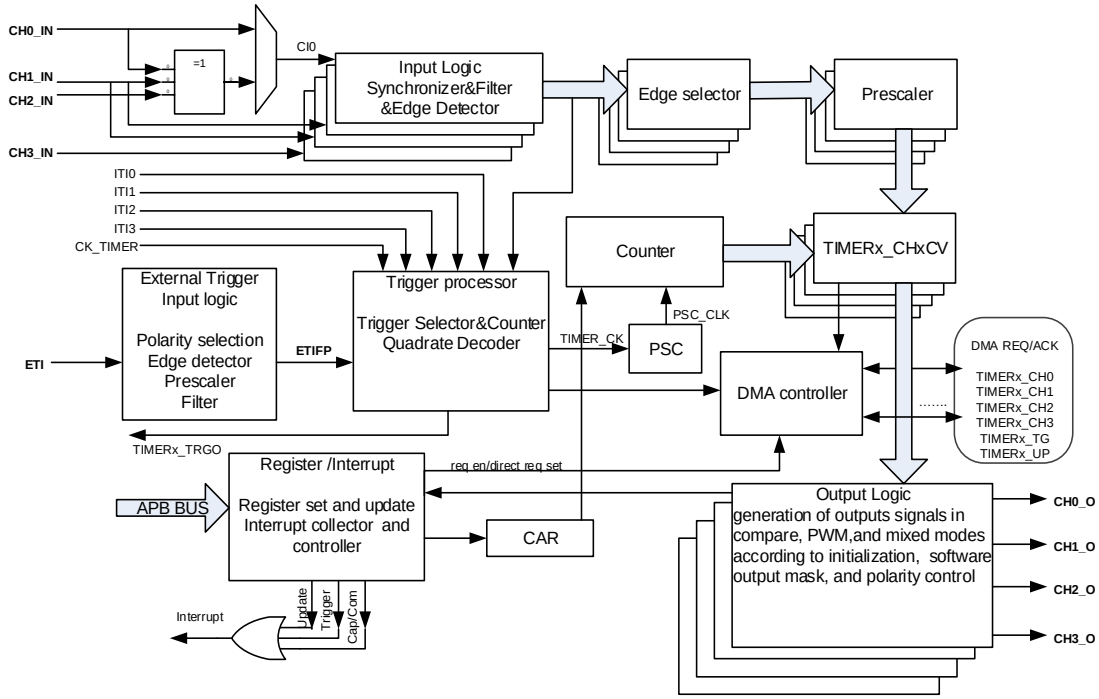
15.2.2. Characteristics

- Total channel num: 4.
- Counter width: 16-bit.
- Clock source of timer is selectable: internal clock, internal trigger, external input, external trigger.
- Multiple counter modes: up counting, down counting and center-aligned counting.
- Quadrature decoder: used for motion tracking and determination of both rotation direction and position.
- Hall sensor function: used for 3-phase motor control.
- Programmable prescaler: 16-bit. The factor can be changed ongoing.
- Each channel is user-configurable: input capture mode, output compare mode, programmable PWM mode and single pulse mode
- Auto-reload function.
- Interrupt output or DMA request: update event, trigger event and compare/capture event.
- Daisy chaining of timer modules to allow a single timer to initiate multiple timing events.
- Timer synchronization allows selected timers to start counting on the same clock cycle.
- Timer master-slave management.

15.2.3. Block diagram

Figure 15-30. General Level 0 timer block diagram provides details on the internal configuration of the general level0 timer.

Figure 15-30. General Level 0 timer block diagram



15.2.4. Function overview

Clock source configuration

The clock source of the general level0 TIMER can be either the CK_TIMER or an alternate clock source controlled by SMC bits (TIMERx_SMCFG bit[2:0]).

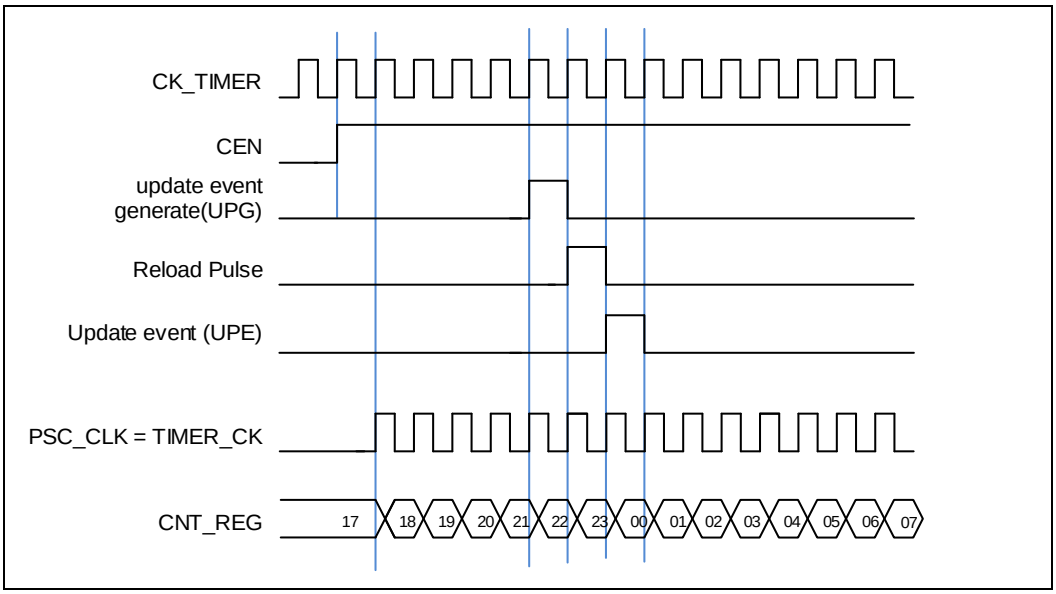
- SMC [2:0] == 3'b000. Internal timer clock CK_TIMER which is from module RCU.

The default clock source is the CK_TIMER for driving the counter prescaler when the SMC [2:0] == 3'b000. When the CEN is set, the CK_TIMER will be divided by PSC value to generate PSC_CLK.

In this mode, the TIMER_CK which drives counter's prescaler to count is equal to CK_TIMER which is from RCU module.

If the SMC [2:0] in the TIMERx_SMCFG register are setting to an available value including 0x1, 0x2, 0x3 and 0x7, the prescaler is clocked by other clock sources selected by the TRGS [2:0] in the TIMERx_SMCFG register, more details will be introduced later. When the SMC [2:0] bits are set to 0x4, 0x5 or 0x6, the Internal clock CK_TIMER is the counter prescaler driving clock source.

Figure 15-31. Timing chart of internal clock divided by 1



- SMC [2:0] == 3'b111 (external clock mode 0). External input pin is selected as timer clock source

The TIMER_CK, which drives counter's prescaler to count, can be triggered by the event of rising or falling edge on the external pin TIMERx_CH0/TIMERx_CH1. This mode can be selected by setting SMC [2:0] to 0x7 and the TRGS [2:0] to 0x4, 0x5 or 0x6.

And, the counter prescaler can also be driven by rising edge on the internal trigger input pin ITI0/1/2/3. This mode can be selected by setting SMC [2:0] to 0x7 and the TRGS [2:0] to 0x0, 0x1, 0x2 or 0x3.

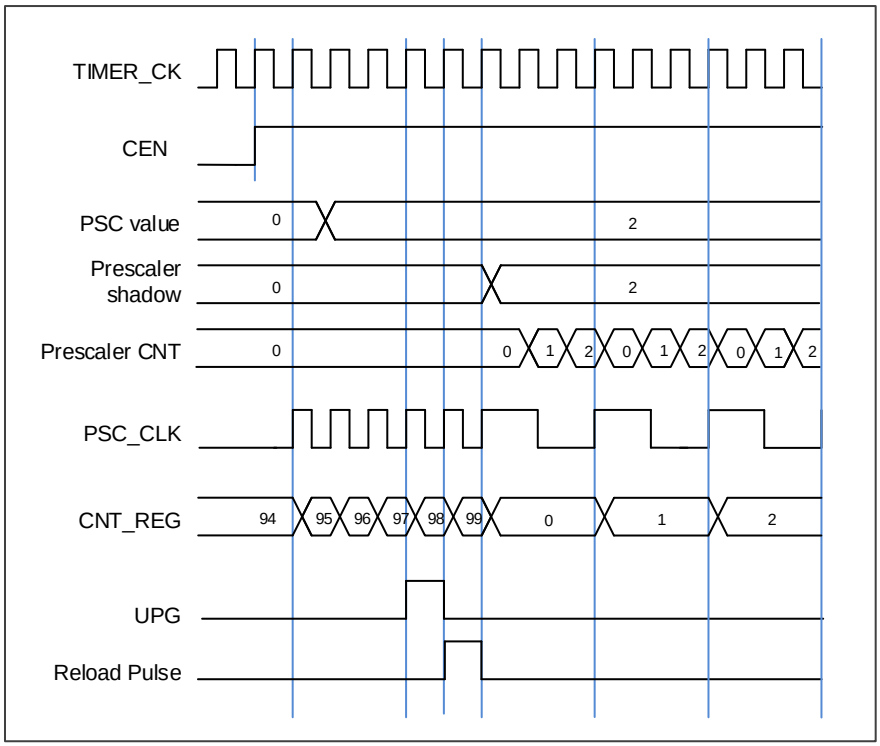
- SMC1== 1'b1 (external clock mode 1). External input ETI is selected as timer clock source

The TIMER_CK, which drives counter's prescaler to count, can be triggered by the event of rising or falling edge on the external pin ETI. This mode can be selected by setting the SMC1 bit in the TIMERx_SMCFG register to 1. The other way to select the ETI signal as the clock source is setting the SMC [2:0] to 0x7 and the TRGS [2:0] to 0x7. Note that the ETI signal is derived from the ETI pin sampled by a digital filter. When the ETI signal is selected as the clock source, the trigger controller including the edge detection circuitry will generate a clock pulse on each ETI signal rising edge to clock the counter prescaler.

Clock prescaler

The counter clock (PSC_CK) is obtained by the TIMER_CK through the prescaler, and the prescale factor can be configured from 1 to 65536 through the prescaler register (TIMERx_PSC). The new written prescaler value will not take effect until the next update event.

Figure 15-32. Timing chart of PSC value change from 0 to 2



Counter up counting

In this mode, the counter counts up continuously from 0 to the counter-reload value, which is defined in the TIMERx_CAR register, in a count-up direction. Once the counter reaches the counter reload value, the counter restarts to count once again from 0. The update event is generated at each counter overflow. The counting direction bit DIR in the TIMERx_CTL1 register should be set to 0 for the up counting mode.

Whenever, if the update event software trigger is enabled by setting the UPG bit in the TIMERx_SWEVG register, the counter value will be initialized to 0 and an update event will be generated.

If the UPDIS bit in TIMERx_CTL0 register is set, the update event is disabled.

When an update event occurs, all the shadow registers (counter auto reload register, prescaler register) are updated.

Figure 15-33. Timing chart of up counting mode, PSC=0/2 and *Figure 15-34. Timing chart of up counting mode, change TIMERx_CAR ongoing* show some examples of the counter behavior for different clock prescaler factors when TIMERx_CAR=0x99.

Figure 15-33. Timing chart of up counting mode, PSC=0/2

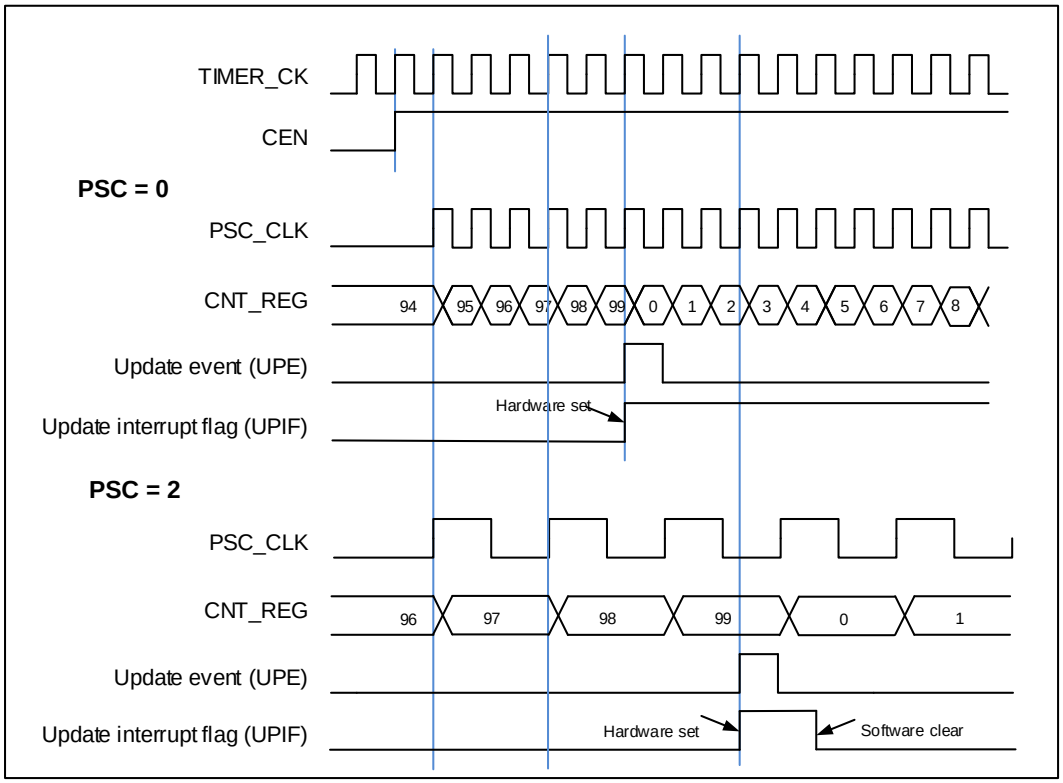


Figure 15-34. Timing chart of up counting mode, change TIMERx_CAR ongoing

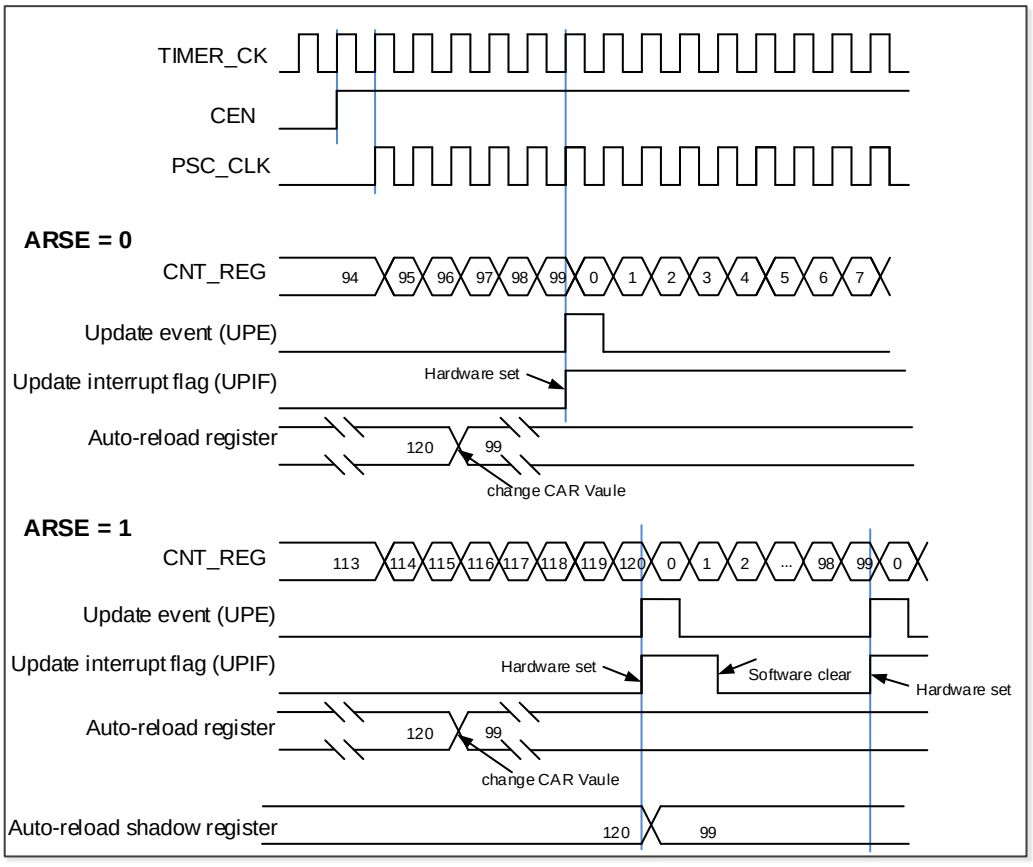

Counter down counting

In this mode, the counter counts down continuously from the counter reload value, which is defined in the TIMERx_CAR register, in a count-down direction. Once the counter reaches 0, the counter restarts to count again from the counter reload value. The update event is generated each time when counter underflows. The counting direction bit DIR in the TIMERx_CTL0 register should be set to 1 for the down-counting mode.

When the update event is set by the UPG bit in the TIMERx_SWEVG register, the counter value will be initialized to the counter reload value and an update event will be generated.

If the UPDIS bit in TIMERx_CTL0 register is set, the update event is disabled.

When an update event occurs, all the shadow registers (counter auto reload register, prescaler register) are updated.

Figure 15-35. Timing chart of down counting mode, PSC=0/2 and *Figure 15-36. Timing chart of down counting mode, change TIMERx_CAR*.show some examples of the counter behavior in different clock frequencies when TIMERx_CAR = 0x99.

Figure 15-35. Timing chart of down counting mode, PSC=0/2

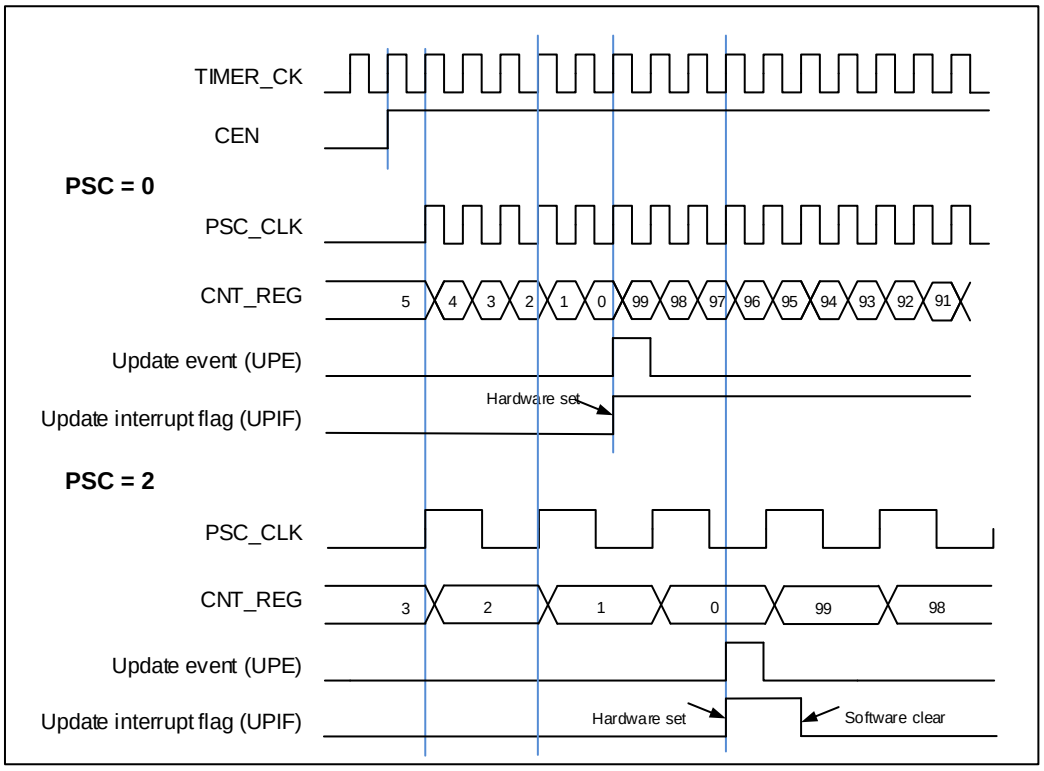

Figure 15-36. Timing chart of down counting mode, change TIMERx_CAR.

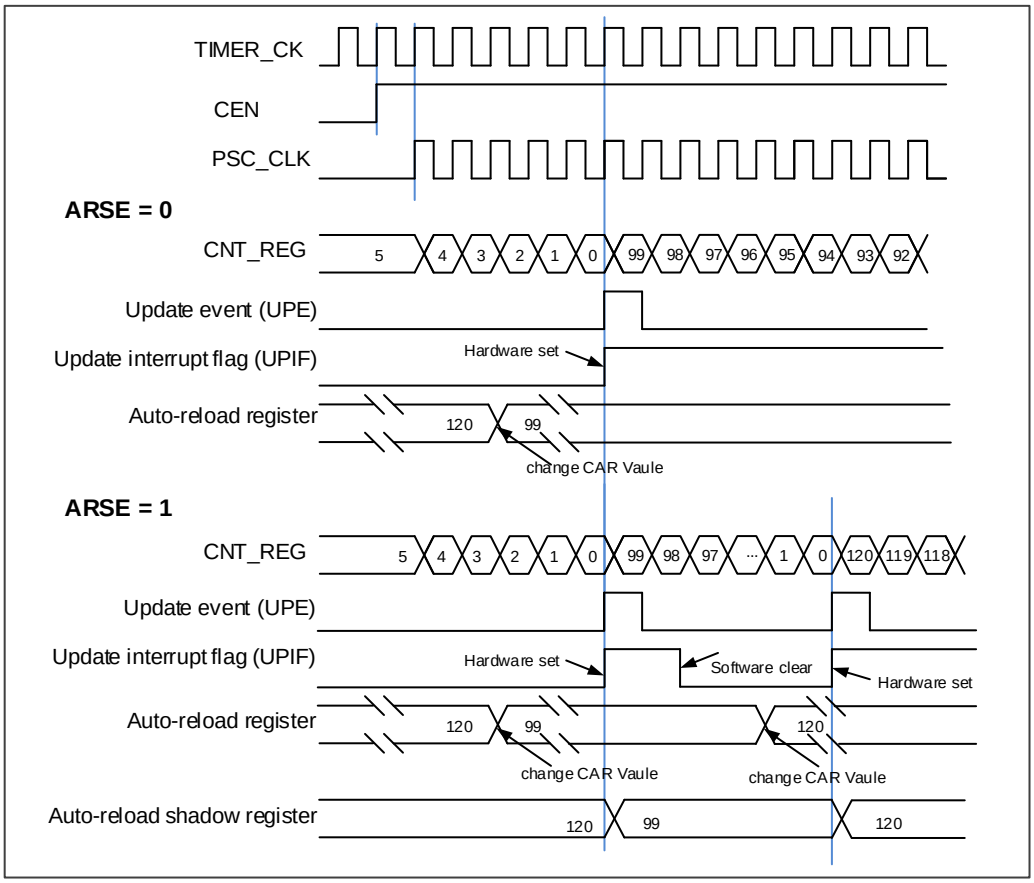


Counter center-aligned counting

In this mode, the counter counts up from 0 to the counter-reload value and then counts down to 0 alternatively. The Timer module generates an overflow event when the counter counts to the counter-reload value subtract 1 in the up-counting direction and generates an underflow event when the counter counts to 1 in the down-counting mode. The counting direction bit DIR in the TIMERx_CTL0 register is read-only and indicates the counting direction when in the center-aligned mode.

Setting the UPG bit in the TIMERx_SWEVG register will initialize the counter value to 0 and generate an update event irrespective of whether the counter is counting up or down in the center-aligned counting mode.

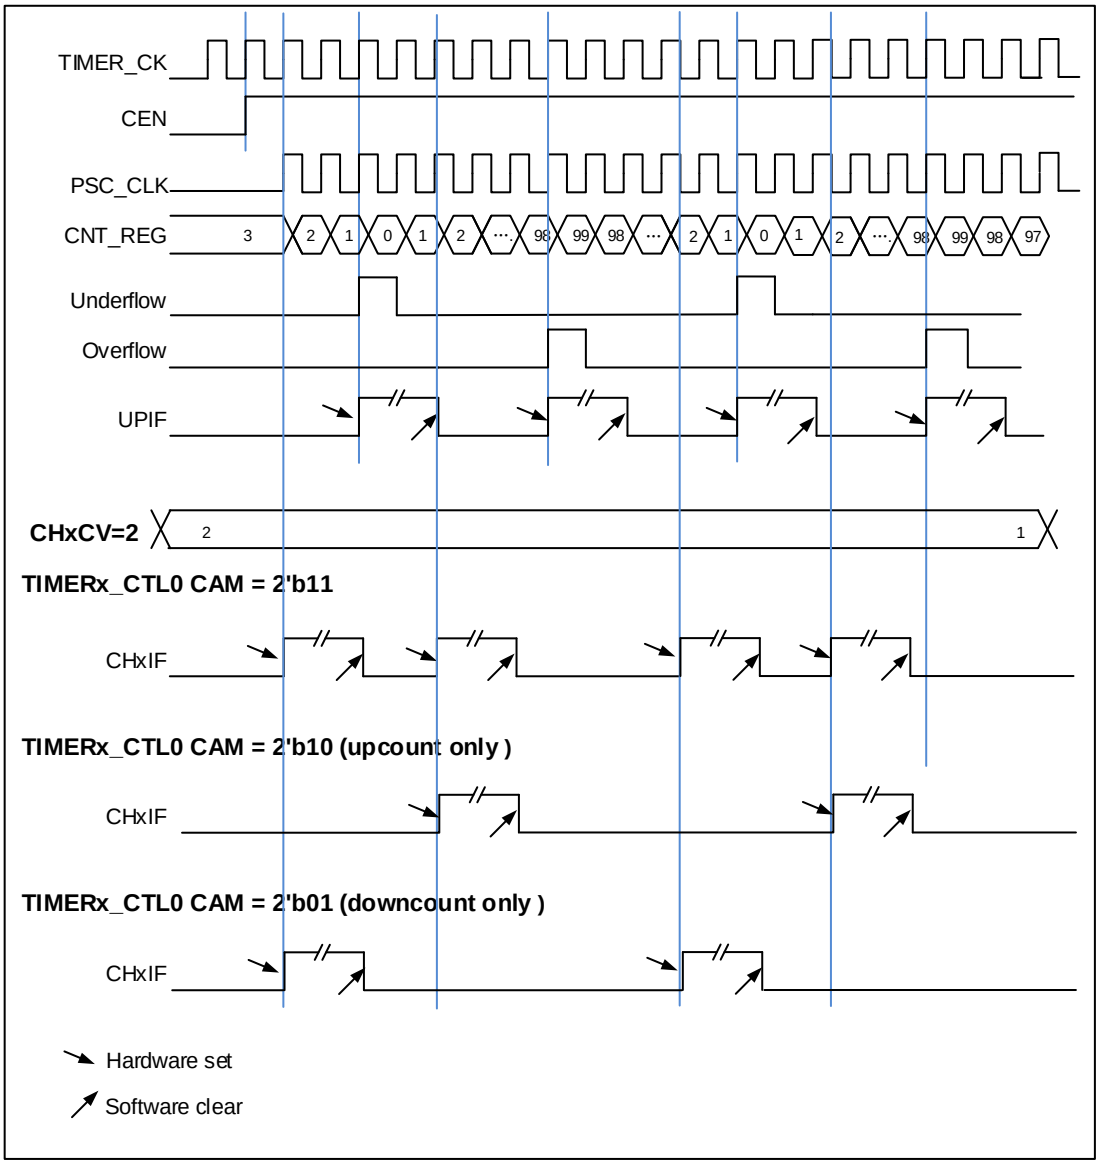
The UPIF bit in the TIMERx_INTF register will be set to 1 either when an underflow event or an overflow event occurs. While the CHxIF bit is associated with the value of CAM in TIMERx_CTL0. The details refer to. ***Figure 15-37. Timing chart of center-aligned counting mode.***

If the UPDIS bit in the TIMERx_CTL0 register is set, the update event is disabled.

When an update event occurs, all the shadow registers (counter auto-reload register, prescaler register) are updated.

Figure 15-37. Timing chart of center-aligned counting mode show some examples of the counter behavior when TIMERx_CAR=0x99. TIMERx_PSC=0x0

Figure 15-37. Timing chart of center-aligned counting mode



Input capture and output compare channels

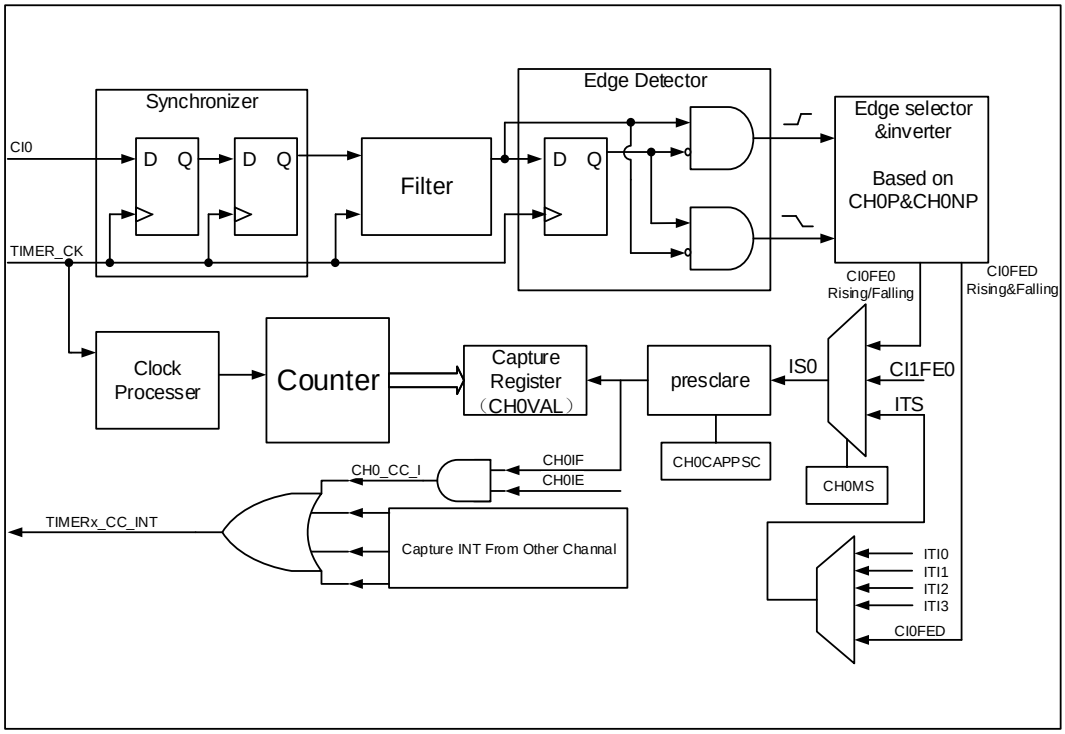
The general level0 Timer has four independent channels which can be used as capture inputs or compare outputs. Each channel is built around a channel capture compare register including an input stage, a channel controller and an output stage.

- Channel input capture function

Channel input capture function allows the channel to perform measurements such as pulse timing, frequency, period, duty cycle and so on. The input stage consists of a digital filter, a channel polarity selection, edge detection and a channel prescaler. When a selected edge occurs on the channel input, the current value of the counter is captured into the TIMERx_CHxCV register, at the same time the CHxIF bit is set and the channel interrupt is

generated if it is enabled when CHxIE=1.

Figure 15-38. Channel input capture principle



The input signals of channelx (CIx) can be the TIMERx_CHx signal or the XOR signal of the TIMERx_CH0, TIMERx_CH1 and TIMERx_CH2 signals. First, the input signal of channel (CIx) is synchronized to TIMER_CK signal, and then sampled by a digital filter to generate a filtered input signal. Then through the edge detector, the rising or falling edge is detected by configuring CHxP bit. The input capture signal can also be selected from the input signal of other channel or the internal trigger signal by configuring CHxMS bits. The IC prescaler makes several input events generate one effective capture event. On the capture event, TIMERx_CHxCV will store the value of counter.

So the process can be divided to several steps as below:

Step1: Filter configuration (CHxCAPFLT in TIMERx_CHCTL0).
Based on the input signal and quality of requested signal, configure compatible CHxCAPFLT.

Step2: Edge selection (CHxP/CHxNP in TIMERx_CHCTL2).
Rising edge or falling edge, choose one by configuring CHxP/CHxNP bits.

Step3: Capture source selection (CHxMS in TIMERx_CHCTL0).
As soon as selecting one input capture source by CHxMS, the channel must be set to input mode (CHxMS! =0x0) and TIMERx_CHxCV cannot be written any more.

Step4: Interrupt enable (CHxIE and CHxDEN in TIMERx_DMAINTEN).
Enable the related interrupt to get the interrupt and DMA request.

Step5: Capture enable (CHxEN in TIMERx_CHCTL2).

Result: When the wanted input signal is captured, TIMERx_CHxCV will be set by counter's value and CHxIF is asserted. If the CHxIF is 1, the CHxOF will also be asserted. The

interrupt and DMA request will be asserted or not based on the configuration of CHxIE and CHxDEN in TIMERx_DMAINTEN.

Direct generation: A DMA request or interrupt is generated by setting CHxG directly.

The channel input capture function can be also used for pulse width measurement from signals on the TIMERx_CHx pins. For example, PWM signal connects to CI0 input. Select CI0 as channel 0 capture signals by setting CH0MS to 2'b01 in the channel control register (TIMERx_CHCTL0) and set capture on rising edge. Select CI0 as channel 1 capture signal by setting CH1MS to 2'b10 in the channel control register (TIMERx_CHCTL0) and set capture on falling edge. The counter is set to restart mode and is restarted on channel 0 rising edge. Then the TIMERX_CH0CV can measure the PWM period and the TIMERx_CH1CV can measure the PWM duty cycle.

- Channel output compare function

In channel output compare function, the TIMERx can generate timed pulses with programmable position, polarity, duration and frequency. When the counter matches the value in the TIMERx_CHxCV register of an output compare channel, the channel (n) output can be set, cleared, or toggled based on CHxCOMCTL. When the counter reaches the value in the TIMERx_CHxCV register, the CHxIF bit will be set and the channel (n) interrupt is generated if CHxIE = 1. And the DMA request will be asserted, if CxCDE=1.

So the process can be divided into several steps as below:

Step1: Clock configuration. Such as clock source, clock prescaler and so on.

Step2: Compare mode configuration.

- Set the shadow enable mode by CHxCOMSEN
- Set the output mode (Set/Clear/Toggle) by CHxCOMCTL
- Select the active high polarity by CHxP
- Enable the output by CHxEN

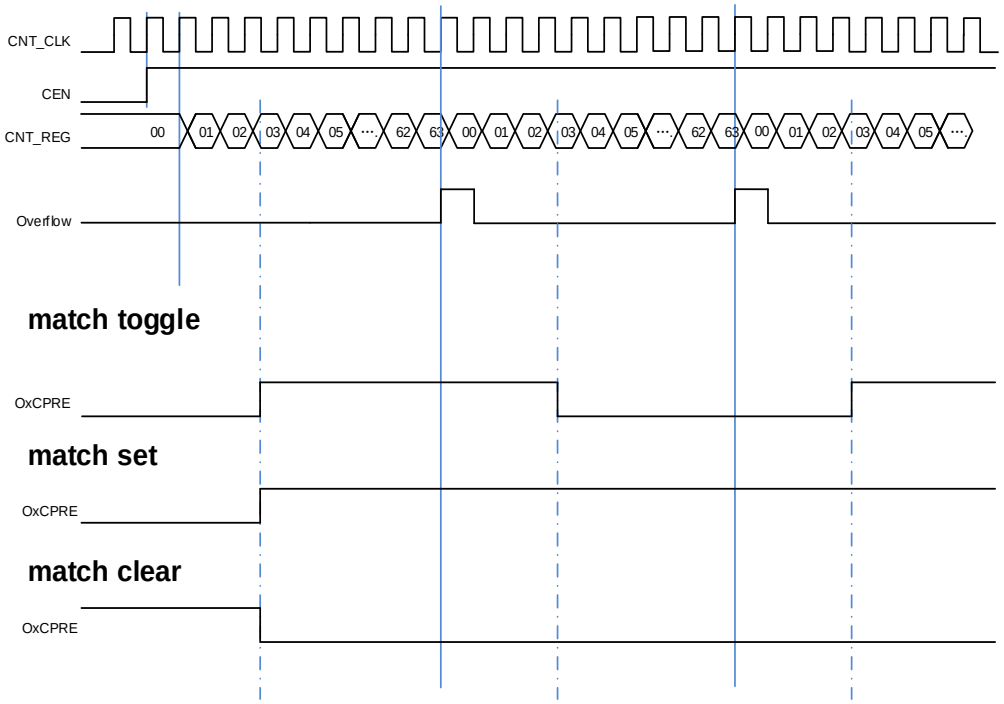
Step3: Interrupt/DMA-request enables configuration by CHxIE/CxDEN

Step4: Compare output timing configuration by TIMERx_CAR and TIMERx_CHxCV.
About the CHxVAL, you can change it on the go to meet the waveform you expected.

Step5: Start the counter by configuring CEN to 1.

Figure 15-39. Output-compare in three modes show the three compare modes toggle/set/clear. CAR=0x63, CHxVAL=0x3

Figure 15-39. Output-compare in three modes



Output PWM function

In the output PWM function (by setting the CHxCOMCTL bit to 3'b110 (PWM mode 0) or to 3'b 111(PWM mode 1)), the channel can generate PWM waveform according to the TIMERx_CAR registers and TIMERx_CHxCV registers.

Based on the counter mode, PWM can also be divided into EAPWM (Edge-aligned PWM) and CAPWM (Center-aligned PWM).

The EAPWM's period is determined by TIMERx_CAR and the duty cycle is determined by TIMERx_CHxCV. ***Figure 15-40. EAPWM timechart*** shows the EAPWM output and interrupts waveform.

The CAPWM period is determined by 2*TIMERx_CAR, and duty cycle is determined by 2*TIMERx_CHxCV. ***Figure 15-41. CAPWM timechart*** shows the CAPWM output and interrupts waveform.

If TIMERx_CHxCV is greater than TIMERx_CAR, the output will be always active under PWM mode0 (CHxCOMCTL==3'b110).
And if TIMERx_CHxCV is equal to zero, the output will be always inactive under PWM mode0 (CHxCOMCTL==3'b110).

Figure 15-40. EAPWM timechart

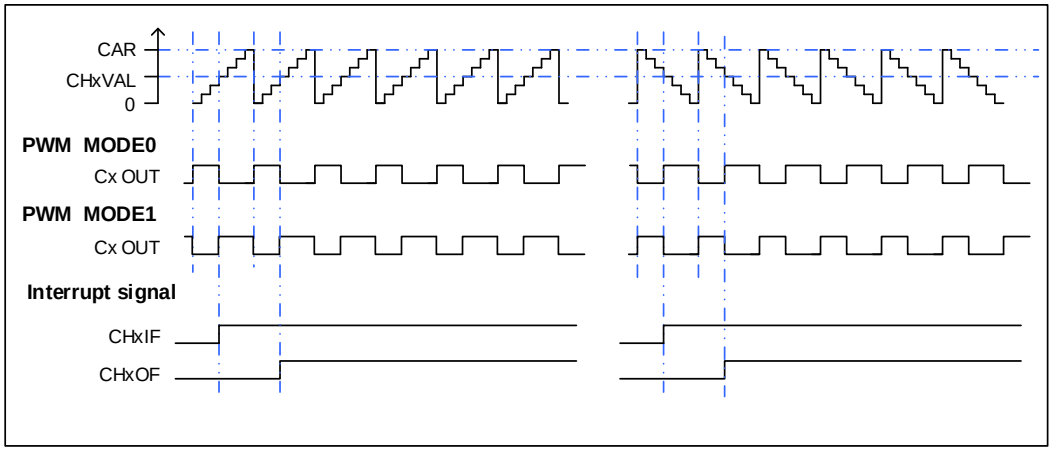


Figure 15-41. CAPWM timechart

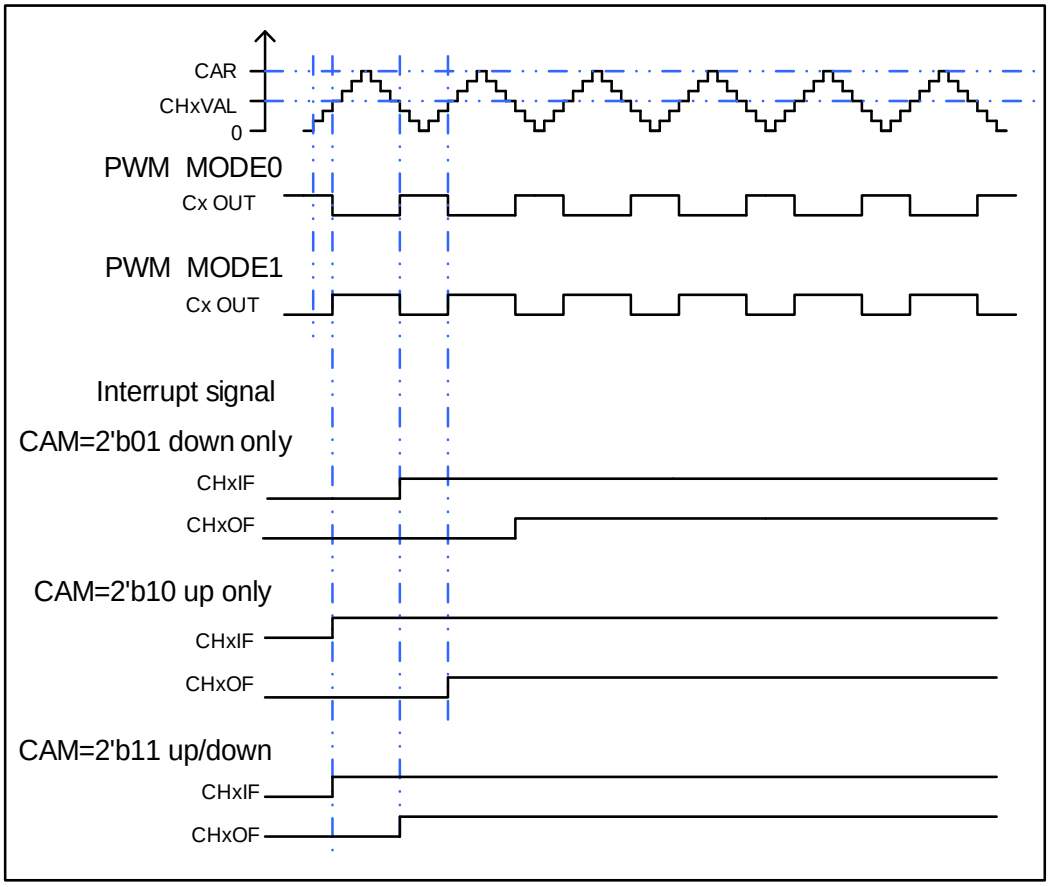


Channel output prepare signal

When the TIMERx is used in the compare match output mode, the OxCPRE signal (Channel x Output prepare signal) is defined by setting the CHxCOMCTL filed. The OxCPRE signal has several types of output function. These include, keeping the original level by setting the CHxCOMCTL field to 0x00, set to 1 by setting the CHxCOMCTL field to 0x01, set to 0 by setting the CHxCOMCTL field to 0x02 or signal toggle by setting the CHxCOMCTL field to

0x03 when the counter value matches the content of the TIMERx_CHxCV register.

The PWM mode 0 and PWM mode 1 outputs are also another kind of OxCPRE output which is setup by setting the CHxCOMCTL field to 0x06/0x07. In these modes, the OxCPRE signal level is changed according to the counting direction and the relationship between the counter value and the TIMERx_CHxCV content. With regard to a more detail description refer to the relative bit definition.

Another special function of the OxCPRE signal is a forced output which can be achieved by setting the CHxCOMCTL field to 0x04/0x05. Here the output can be forced to an inactive/active level irrespective of the comparison condition between the counter and the TIMERx_CHxCV values.

The OxCPRE signal can be forced to 0 when the ETIFP signal is derived from the external ETI pin and when it is set to a high level by setting the CHxCOMCEN bit to 1 in the TIMERx_CHCTL0 register. The OxCPRE signal will not return to its active level until the next update event occurs.

Quadrature decoder

Refer to ***Quadrature decoder***.

Hall sensor function

Refer to ***Hall sensor function***.

Master-slave management

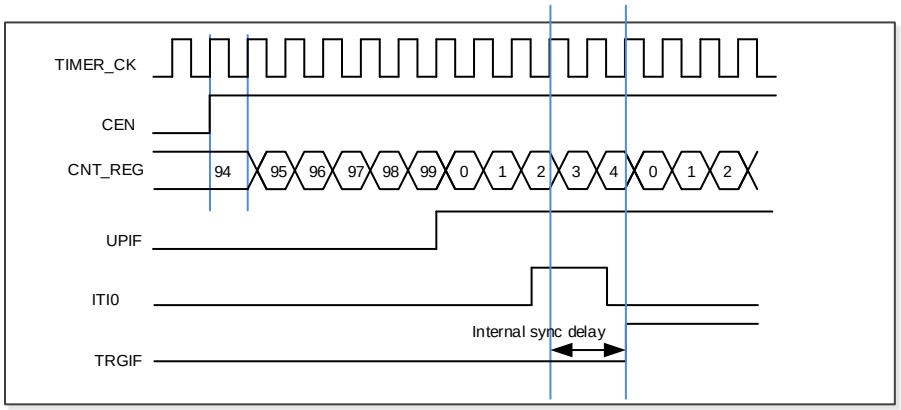
The TIMERx can be synchronized with a trigger in several modes including restart mode, pause mode and event mode which is selected by the SMC[2:0] bits in the TIMERx_SMCFG register. The input trigger of these modes can be selected by the TRGS[2:0] bits in the TIMERx_SMCFG register.

Table 15-5. Slave mode example table

	Mode Selection	Source Selection	Polarity Selection	Filter and Prescaler
LIST	SMC[2:0] 3'b100 (restart mode) 3'b101 (pause mode) 3'b110 (event mode)	TRGS[2:0] 000: ITI0 001: ITI1 010: ITI2 011: ITI3 100: CI0F_ED 101: CI0FE0 110: CI1FE1 111: ETIFP	If you choose the CI0FE0 or CI1FE1, configure the CHxP and CHxNP for the polarity selection and inversion. If you choose the ETIF, configure the ETP for polarity selection and inversion.	For the ITIx no filter and prescaler can be used. For the CIx, configure Filter by CHxCAPFLT, no prescaler can be used. For the ETIF, configure Filter by ETFC and Prescaler by ETPSC.

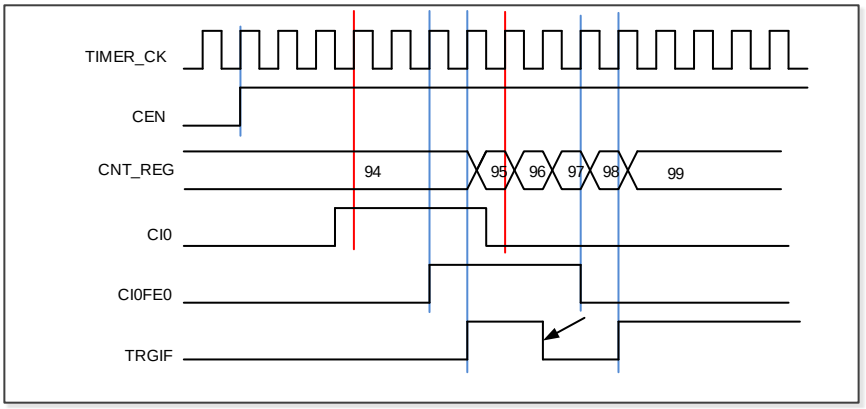
	Mode Selection	Source Selection	Polarity Selection	Filter and Prescaler
Exam1	**Restart mode** The counter can be clear and restart when a rising trigger input.	TRGS[2:0]=3'b000 ITI0 is the selection.	For ITI0, no polarity selector can be used.	For the ITI0, no filter and prescaler can be used.

Figure 15-42. Restart mode



Exam2	**Pause mode** The counter can be paused when the trigger input is low.	TRGS[2:0]=3'b101 CI0FE0 is the selection.	TI0S=0.（Non-xor） [CH0NP==0, CH0P==0] no inverted. Capture will be sensitive to the rising edge only.	Filter is bypass in this example.

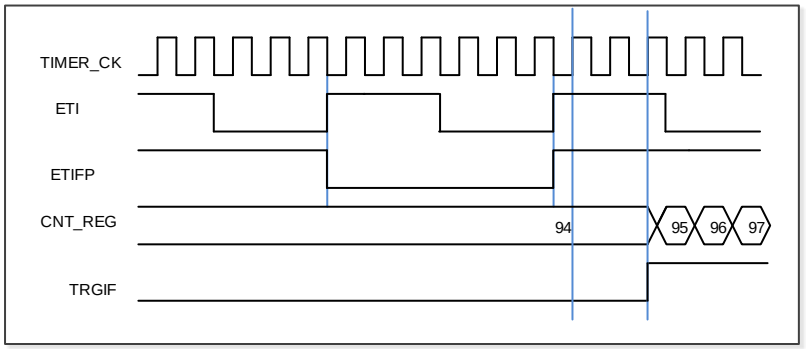
Figure 15-43. Pause mode



Exam3	**Event mode** The counter will start to count when a rising trigger input.	TRGS[2:0]=3'b111 ETIF is the selection.	ETP = 0 no polarity change.	ETPSC = 1, divided by 2. ETFC = 0 , no filter

	Mode Selection	Source Selection	Polarity Selection	Filter and Prescaler

Figure 15-44. Event mode



Single pulse mode

Refer to ***Single pulse mode***.

Timers interconnection

Refer to ***Advanced timer (TIMERx, x=0)***.

Timer DMA mode

Timer DMA mode is the function that configures timer's register by DMA module. The relative registers are TIMERx_DMACFG and TIMERx_DMATB. Corresponding DMA request bit should be asserted to enable DMA request for internal interrupt event. TIMERx will send a request to DMA when the interrupt event occurs. DMA is configured to M2P (memory to peripheral) mode and the address of TIMERx_DMATB is configured to PADDR (peripheral base address), then DMA will access the TIMERx_DMATB. In fact, TIMERx_DMATB register is only a buffer, timer will map the TIMERx_DMATB to an internal register, appointed by the field of DMATA in TIMERx_DMACFG. If the field of DMATC in TIMERx_DMACFG is 0 (1 transfer), the timer sends only one DMA request. While if TIMERx_DMATC is not 0, such as 3 (4 transfers), then timer will send 3 more requests to DMA, and DMA will access timer's registers DMATA+0x4, DMATA+0x8 and DMATA+0xC at the next 3 accesses to TIMERx_DMATB. In a word, one-time DMA internal interrupt event asserts, (DMATC+1) times request will be sent by TIMERx.

If one more DMA request event occurs, TIMERx will repeat the process above.

Timer debug mode

When the RISC-V core halted, and the TIMERx_HOLD configuration bit in DBG_CTL register set to 1, the TIMERx counter stops.

15.2.5. TIMERx registers(x=1,2,3,4)

TIMER1 base address: 0x40000000

TIMER2 base address: 0x40000400
TIMER3 base address: 0x40000800
TIMER4 base address: 0x40000C00

Control register 0 (TIMERx_CTL0)

Address offset: 0x00
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved						CKDIV[1:0]		ARSE	CAM[1:0]		DIR	SPM	UPS	UPDIS	CEN
						rw		rw	rw		rw	rw	rw	rw	rw

Bits	Fields	Descriptions
15:10	Reserved	Must be kept at reset value
9:8	CKDIV[1:0]	Clock division The CKDIV bits can be configured by software to specify division factor between the CK_TIMER and the dead-time and digital filter sample clock (DTS). 00: $f_{DTS}=f_{CK\_TIMER}$ 01: $f_{DTS}= f_{CK\_TIMER} /2$ 10: $f_{DTS}= f_{CK\_TIMER} /4$ 11: Reserved
7	ARSE	Auto-reload shadow enable 0: The shadow register for TIMERx_CAR register is disabled 1: The shadow register for TIMERx_CAR register is enabled
6:5	CAM[1:0]	Counter aligns mode selection 00: No center-aligned mode (edge-aligned mode). The direction of the counter is specified by the DIR bit. 01: Center-aligned and counting down assert mode. The counter counts under center-aligned and channel is configured in output mode (CHxMS=00 in TIMERx_CHCTL0 register). Only when counting down, CHxF bit can be set. 10: Center-aligned and counting up assert mode. The counter counts under center-aligned and channel is configured in output mode (CHxMS=00 in TIMERx_CHCTL0 register). Only when counting up, CHxF bit can be set. 11: Center-aligned and counting up/down assert mode. The counter counts under center-aligned and channel is configured in output mode (CHxMS=00 in TIMERx_CHCTL0 register). Both when counting up and counting down, CHxF bit can be set. After the counter is enabled, cannot be switched from 0x00 to non 0x00.
4	DIR	Direction

		0: Count up 1: Count down If the timer work in center-aligned mode or quadrature decoder mode, this bit is read only.
3	SPM	Single pulse mode. 0: Single pulse mode disable. The counter continues after update event. 1: Single pulse mode enable. The counter counts until the next update event occurs.
2	UPS	Update source This bit is used to select the update event sources by software. 0: These events generate update interrupts or DMA requests: The UPG bit is set The counter generates an overflow or underflow event The restart mode generates an update event. 1: This event generates update interrupts or DMA requests: The counter generates an overflow or underflow event
1	UPDIS	Update disable. This bit is used to enable or disable the update event generation. 0: Update event enable. When an update event occurs, the corresponding shadow registers are loaded with their preloaded values. These events generate update event: The UPG bit is set The counter generates an overflow or underflow event The restart mode generates an update event. 1: Update event disable. **Note:** When this bit is set to 1, setting UPG bit or the restart mode does not generate an update event, but the counter and prescaler are initialized.
0	CEN	Counter enable 0: Counter disable 1: Counter enable The CEN bit must be set by software when timer works in external clock, pause mode and quadrature decoder mode.

Control register 1 (TIMERx_CTL1)

Address offset: 0x04
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved								TI0S	MMC[2:0]			DMAS	Reserved		
								rw	rw			rw			

Bits	Fields	Descriptions
15:8	Reserved	Must be kept at reset value
7	TI0S	Channel 0 trigger input selection 0: The TIMERx_CH0 pin input is selected as channel 0 trigger input. 1: The result of combinational XOR of TIMERx_CH0, CH1 and CH2 pins is selected as channel 0 trigger input.
6:4	MMC[2:0]	Master mode control These bits control the selection of TRGO signal, which is sent in master mode to slave timers for synchronization function. 000: When a counter reset event occurs, a TRGO trigger signal is output. The counter resert source: Master timer generate a reset the UPG bit in the TIMERx_SWEVG register is set 001: Enable. When a conter start event occurs, a TRGO trigger signal is output. The counter start source : CEN control bit is set The trigger input in pause mode is high 010: When an update event occurs, a TRGO trigger signal is output. The update source depends on UPDIS bit and UPS bit. 011: When a capture or compare pulse event occurs in channel0, a TRGO trigger signal is output. 100: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O0CPRE. 101: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O1CPRE. 110: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O2CPRE. 111: When a compare event occurs, a TRGO trigger signal is output. The compare source is from O3CPRE.
3	DMAS	DMA request source selection 0: When capture or compare event occurs, the DMA request of channel x is sent 1: When update event occurs, the DMA request of channel x is sent.
2:0	Reserved	Must be kept at reset value.

Slave mode configuration register (TIMERx_SMCFG)

Address offset: 0x08
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ETP	SMC1	ETPSC[1:0]		ETFC[3:0]				MSM	TRGS[2:0]			Reserved	SMC[2:0]		
rw	rw	rw		rw				rw	rw				rw		

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15	ETP	External trigger polarity This bit specifies the polarity of ETI signal 0: ETI is active at rising edge or high level . 1: ETI is active at falling edge or low level .
14	SMC1	Part of SMC for enable External clock mode1. In external clock mode 1, the counter is clocked by any active edge on the ETIFP signal. 0: External clock mode 1 disabled 1: External clock mode 1 enabled. When the slave mode is configured as restart mode, pause mode or event mode, the timer can still work in the external clock 1 mode by setting this bit. But the TRGS bits must not be 3'b111 in this case. The clock source of the timer will be ETIFP if external clock mode 0 and external clock mode 1 are configured at the same time. **Note:** External clock mode 0 enable is in this register's SMC[2:0] bit-filed.
13:12	ETPSC[1:0]	The prescaler of external trigger The frequency of external trigger signal ETIFP must not be at higher than 1/4 of TIMER_CK frequency. When the external trigger signal is a fast clock, the prescaler can be enabled to reduce ETIFP frequency. 00: Prescaler disable. 01: The prescaler is 2. 10: The prescaler is 4. 11: The prescaler is 8.
11:8	ETFC[3:0]	External trigger filter control The external trigger can be filtered by digital filter and this bit-field configure the filtering capability. Basic principle of digital filter: continuously sample the external trigger signal according to f_{SAMP} and record the number of times of the same level of the signal. After reaching the filtering capacity configured by this bit-field, it is considered to be an effective level. The filtering capability configuration is as follows:

EXTFC[3:0]	Times	f_{SAMP}
4'b0000	Filter disabled.	
4'b0001	2	f_{TIMER_CK}
4'b0010	4	
4'b0011	8	
4'b0100	6	$f_{DTS\_CK}/2$
4'b0101	8	
4'b0110	6	$f_{DTS\_CK}/4$
4'b0111	8	
4'b1000	6	$f_{DTS\_CK}/8$
4'b1001	8	
4'b1010	5	$f_{DTS\_CK}/16$
4'b1011	6	
4'b1100	8	
4'b1101	5	$f_{DTS\_CK}/32$
4'b1110	6	
4'b1111	8	

7 MSM

Master-slave mode

This bit can be used to synchronize selected timers to begin counting at the same time. The TRGI is used as the start event, and through TRGO, timers are connected together.

0: Master-slave mode disable

1: Master-slave mode enable

6:4 TRGS[2:0]

Trigger selection

This bit-field specifies which signal is selected as the trigger input, which is used to synchronize the counter.

000: ITI0

001: ITI1

010: ITI2

011: ITI3

100: CI0F_ED

101: CI0FE0

110: CI1FE1

111: ETIFP

These bits must not be changed when slave mode is enabled.

3 Reserved

Must be kept at reset value.

2:0 SMC[2:0]

Slave mode control

000: Disable mode. The slave mode is disabled; The prescaler is clocked directly by the internal clock (TIMER_CK) when CEN bit is set high.

001: Quadrature decoder mode 0.The counter counts on CI0FE0 edge, while the direction depends on CI1FE1 level.

010: Quadrature decoder mode 1.The counter counts on CI1FE1 edge, while the direction depends on CI0FE0 level.
011: Quadrature decoder mode 2.The counter counts on both CI0FE0 and CI1FE1 edge, while the direction depends on each other.
100: Restart mode. The counter is reinitialized and an update event is generated on the rising edge of the selected trigger input.
101: Pause mode. The trigger input enables the counter clock when it is high and disables the counter clock when it is low.
110: Event mode. A rising edge of the trigger input enables the counter.
111: External clock mode 0. The counter counts on the rising edges of the selected trigger.

DMA and interrupt enable register (TIMERx_DMAINTEN)

Address offset: 0x0C
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	UPIE	Update interrupt enable 0: disabled 1: enabled

Interrupt flag register (TIMERx_INTF)

Address offset: 0x10

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved			CH3OF	CH2OF	CH1OF	CH0OF	Reserved		TRGIF	Reserved	CH3IF	CH3IF	CH1IF	CH0IF	UPIF
			rc_w0	rc_w0	rc_w0	rc_w0			rc_w0		rc_w0	rc_w0	rc_w0	rc_w0	rc_w0

Bits	Fields	Descriptions
15:13	Reserved	Must be kept at reset value.
12	CH3OF	Channel 3 over capture flag Refer to CH0OF description

11	CH2OF	Channel 2 over capture flag Refer to CH0OF description
10	CH1OF	Channel 1 over capture flag Refer to CH0OF description
9	CH0OF	Channel 0 over capture flag When channel 0 is configured in input mode, this flag is set by hardware when a capture event occurs while CH0IF flag has already been set. This flag is cleared by software. 0: No over capture interrupt occurred 1: Over capture interrupt occurred
8:7	Reserved	Must be kept at reset value.
6	TRGIF	Trigger interrupt flag This flag is set on trigger event and cleared by software. When in pause mode, both edges on trigger input generates a trigger event, otherwise, only an active edge on trigger input can generates a trigger event. 0: No trigger event occurred. 1: Trigger interrupt occurred.
5	Reserved	Must be kept at reset value.
4	CH3IF	Channel 3 ‘s capture/compare interrupt enable Refer to CH0IF description
3	CH2IF	Channel 2 ‘s capture/compare interrupt enable Refer to CH0IF description
2	CH1IF	Channel 1 ‘s capture/compare interrupt flag Refer to CH0IF description
1	CH0IF	Channel 0 ‘s capture/compare interrupt flag This flag is set by hardware and cleared by software. When channel 0 is in input mode, this flag is set when a capture event occurs. When channel 0 is in output mode, this flag is set when a compare event occurs. If Channel0 is set to input mode, this bit will be reset by reading TIMERx_CH0CV. 0: No Channel 1 interrupt occurred 1: Channel 1 interrupt occurred
0	UPIF	Update interrupt flag This bit is set by hardware on an update event and cleared by software. 0: No update interrupt occurred 1: Update interrupt occurred

Software event generation register (TIMERx_SWEVG)

Address offset: 0x14

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved									TRGG	Reserved	CH3G	CH2G	CH1G	CH0G	UPG
									w		w	w	w	w	w

Bits	Fields	Descriptions
15:7	Reserved	Must be kept at reset value.
6	TRGG	Trigger event generation This bit is set by software and cleared by hardware automatically. When this bit is set, the TRGIF flag in TIMERx_STAT register is set, related interrupt or DMA transfer can occur if enabled. 0: No generate a trigger event 1: Generate a trigger event
5	Reserved	Must be kept at reset value.
4	CH3G	Channel 3's capture or compare event generation Refer to CH0G description
3	CH2G	Channel 2's capture or compare event generation Refer to CH0G description
2	CH1G	Channel 1's capture or compare event generation Refer to CH0G description
1	CH0G	Channel 0's capture or compare event generation This bit is set by software in order to generate a capture or compare event in channel 0, it is automatically cleared by hardware. When this bit is set, the CH1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. In addition, if channel 1 is configured in input mode, the current value of the counter is captured in TIMERx_CH0CV register, and the CH0OF flag is set if the CH0IF flag was already high. 0: No generate a channel 1 capture or compare event 1: Generate a channel 1 capture or compare event
0	UPG	This bit can be set by software, and cleared by hardware automatically. When this bit is set, the counter is cleared if the center-aligned or up counting mode is selected, else (down counting) it takes the auto-reload value. The prescaler counter is cleared

at the same time.

0: No generate an update event

1: Generate an update event

Channel control register 0 (TIMERx_CHCTL0)

Address offset: 0x18

Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CH1COMCEN	CH1COMCTL[2:0]			CH1COMSEN	CH1COMFEN	CH1MS[1:0]		CH0COMCEN	CH0COMCTL[2:0]			CH0COMSEN	CH0COMFEN	CH0MS[1:0]	
CH1CAPFLT[3:0]				CH1CAPPSC[1:0]				CH0CAPFLT[3:0]				CH0CAPPSC[1:0]			
rw				rw		rw		rw				rw		rw	

Output compare mode:

Bits	Fields	Descriptions
15	CH1COMCEN	Channel 1 output compare clear enable Refer to CH0COMCEN description
14:12	CH1COMCTL[2:0]	Channel 1 compare output control Refer to CH0COMCTL description
11	CH1COMSEN	Channel 1 output compare shadow enable Refer to CH0COMSEN description
10	CH1COMFEN	Channel 1 output compare fast enable Refer to CH0COMFEN description
9:8	CH1MS[1:0]	Channel 1 mode selection This bit-field specifies the direction of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH1EN bit in TIMERx_CHCTL2 register is reset). 00: Channel 1 is programmed as output mode 01: Channel 1 is programmed as input mode, IS1 is connected to CI1FE1 10: Channel 1 is programmed as input mode, IS1 is connected to CI0FE1 11: Channel 1 is programmed as input mode, IS1 is connected to ITS. **Note:** When CH1MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.
7	CH0COMCEN	Channel 0 output compare clear enable. When this bit is set, if the ETIFP signal is detected as high level, the O0CPRE signal will be cleared. 0: Channel 0 output compare clear disable 1: Channel 0 output compare clear enable

6:4	CH0COMCTL[2:0]	Channel 0 compare output control This bit-field specifies the compare output mode of the the output prepare signal O0CPRE. In addition, the high level of O0CPRE is the active level, and CH0_O and CH0_ON channels polarity depends on CH0P and CH0NP bits. 000: Timing mode. The O0CPRE signal keeps stable, independent of the comparison between the register TIMERx_CH0CV and the counter TIMERx_CNT. 001: Set the channel output. O0CPRE signal is forced high when the counter is equals to the output compare register TIMERx_CH0CV. 010: Clear the channel output. O0CPRE signal is forced low when the counter is equals to the output compare register TIMERx_CH0CV. 011: Toggle on match. O0CPRE toggles when the counter is equals to the output compare register TIMERx_CH0CV. 100: Force low. O0CPRE is forced to low level. 101: Force high. O0CPRE is forced to high level. 110: PWM mode0. When counting up, O0CPRE is high when the counter is smaller than TIMERx_CH0CV, and low otherwise. When counting down, O0CPRE is low when the counter is larger than TIMERx_CH0CV, and high otherwise. 111: PWM mode1. When counting up, O0CPRE is low when the counter is smaller than TIMERx_CH0CV, and high otherwise. When counting down, O0CPRE is high when the counter is larger than TIMERx_CH0CV, and low otherwise. If configured in PWM mode, the O0CPRE level changes only when the output compare mode is adjusted from “Timing” mode to “PWM” mode or the comparison result changes.
3	CH0COMSEN	Channel 0 compare output shadow enable When this bit is set, the shadow register of TIMERx_CH0CV register, which updates at each update event, will be enabled. 0: Channel 0 output compare shadow disable 1: Channel 0 output compare shadow enable The PWM mode can be used without verifying the shadow register only in single pulse mode (when SPM=1)
2	CH0COMFEN	Channel 0 output compare fast enable When this bit is set, the effect of an event on the trigger in input on the capture/compare output will be accelerated if the channel is configured in PWM0 or PWM1 mode. The output channel will treat an active edge on the trigger input as a compare match, and CH0_O is set to the compare level independently from the result of the comparison. 0: Channel 0 output quickly compare disable. 1: Channel 0 output quickly compare enable.
1:0	CH0MS[1:0]	Channel 0 I/O mode selection This bit-field specifies the work mode of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH0EN bit in TIMERx_CHCTL2 register is reset).).

00: Channel 0 is programmed as output mode
01: Channel 0 is programmed as input mode, IS0 is connected to CI0FE0
10: Channel 0 is programmed as input mode, IS0 is connected to CI1FE0
11: Channel 0 is programmed as input mode, IS0 is connected to ITS
Note: When CH0MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.

Input capture mode:

Bits	Fields	Descriptions
15:12	CH1CAPFLT[3:0]	Channel 1 input capture filter control Refer to CH0CAPFLT description
11:10	CH1CAPPSC[1:0]	Channel 1 input capture prescaler Refer to CH0CAPPSC description
9:8	CH1MS[1:0]	Channel 1 mode selection Same as Output compare mode
7:4	CH0CAPFLT[3:0]	Channel 0 input capture filter control The CI0 input signal can be filtered by digital filter and this bit-field configure the filtering capability. Basic principle of digital filter: continuously sample the CI0 input signal according to f_{SAMP} and record the number of times of the same level of the signal. After reaching the filtering capacity configured by this bit, it is considered to be an effective level. The filtering capability configuration is as follows:

CH0CAPFLT [3:0]	Times	f_{SAMP}
4'b0000	Filter disabled.	
4'b0001	2	f_{CK_TIMER}
4'b0010	4	
4'b0011	8	
4'b0100	6	$f_{DTS}/2$
4'b0101	8	
4'b0110	6	$f_{DTS}/4$
4'b0111	8	
4'b1000	6	$f_{DTS}/8$
4'b1001	8	
4'b1010	5	$f_{DTS}/16$
4'b1011	6	
4'b1100	8	
4'b1101	5	$f_{DTS}/32$
4'b1110	6	
4'b1111	8	

3:2	CH0CAPPSC[1:0]	Channel 0 input capture prescaler This bit-field specifies the factor of the prescaler on channel 0 input. The prescaler

		is reset when CH0EN bit in TIMERx_CHCTL2 register is clear. 00: Prescaler disable, input capture occurs on every channel input edge 01: The input capture occurs on every 2 channel input edges 10: The input capture occurs on every 4 channel input edges 11: The input capture occurs on every 8 channel input edges
1:0	CH0MS[1:0]	Channel 0 mode selection Same as Output compare mode

Channel control register 1 (TIMERx_CHCTL1)

Address offset: 0x1C

Reset value: 0x0000

11	CH3COMSEN	Channel 3 output compare shadow enable Refer to CH0COMSEN description
10	CH3COMFEN	Channel 3 output compare fast enable Refer to CH0COMFEN description
9:8	CH3MS[1:0]	Channel 3 mode selection This bit-field specifies the direction of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH3EN bit in TIMERx_CHCTL2 register is reset). 00: Channel 3 is programmed as output mode 01: Channel 3 is programmed as input mode, IS3 is connected to CI3FE3 10: Channel 3 is programmed as input mode, IS3 is connected to CI2FE3 11: Channel 3 is programmed as input mode, IS3 is connected to ITS. **Note:** When CH3MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.
7	CH2COMCEN	Channel 2 output compare clear enable.

When this bit is set, if the ETIFP signal is detected as high level, the O2CPRE signal will be cleared.
0: Channel 2 output compare clear disable
1: Channel 2 output compare clear enable

6:4 CH2COMCTL[2:0] Channel 2 compare output control
This bit-field specifies the compare output mode of the the output prepare signal O0CPRE. In addition, the high level of O0CPRE is the active level, and CH0_O and CH0_ON channels polarity depends on CH0P and CH0NP bits.
000: Timing mode. The O2CPRE signal keeps stable, independent of the comparison between the output compare register TIMERx_CH2CV and the counter TIMERx_CNT.
001: Set the channel output. O2CPRE signal is forced high when the counter is equals to the output compare register TIMERx_CH2CV.
010: Clear the channel output. O2CPRE signal is forced low when the counter is equals to the output compare register TIMERx_CH2CV.
011: Toggle on match. O2CPRE toggles when the counter is equals to the output compare register TIMERx_CH2CV.
100: Force low. O2CPRE is forced to low level.
101: Force high. O2CPRE is forced to high level.
110: PWM mode 0. When counting up, O2CPRE is high when the counter is smaller than TIMERx_CH2CV, and low otherwise. When counting down, O2CPRE is low when the counter is larger than TIMERx_CH2CV, and high otherwise.
111: PWM mode 1. When counting up, O2CPRE is low when the counter is smaller than TIMERx_CH2CV, and high otherwise. When counting down, O2CPRE is high when the counter is larger than TIMERx_CH2CV, and low otherwise.
If configured in PWM mode, the O2CPRE level changes only when the output compare mode is adjusted from “Timing” mode to “PWM” mode or the comparison result changes.

3 CH2COMSEN Channel 2 compare output shadow enable
When this bit is set, the shadow register of TIMERx_CH2CV register, which updates at each update event will be enabled.
0: Channel 2 output compare shadow disable
1: Channel 2 output compare shadow enable
The PWM mode can be used without verifying the shadow register only in single pulse mode (when SPM=1)

2 CH2COMFEN Channel 2 output compare fast enable
When this bit is set, the effect of an event on the trigger in input on the capture/compare output will be accelerated if the channel is configured in PWM1 or PWM2 mode. The output channel will treat an active edge on the trigger input as a compare match, and CH2_O is set to the compare level independently from the result of the comparison.
0: Channel 2 output quickly compare disable.

1: Channel 2 output quickly compare enable.

1:0 CH2MS[1:0] Channel 2 I/O mode selection

This bit-field specifies the work mode of the channel and the input signal selection. This bit-field is writable only when the channel is not active. (CH2EN bit in TIMERx_CHCTL2 register is reset).).

00: Channel 2 is programmed as output mode

01: Channel 2 is programmed as input mode, IS2 is connected to CI2FE2

10: Channel 2 is programmed as input mode, IS2 is connected to CI3FE2

11: Channel 2 is programmed as input mode, IS2 is connected to ITS.

Note: When CH2MS[1:0]=11, it is necessary to select an internal trigger input through TRGS bits in TIMERx_SMCFG register.

Input capture mode:

Bits	Fields	Descriptions
15:12	CH3CAPFLT[3:0]	Channel 3 input capture filter control Refer to CH0CAPFLT description
11:10	CH3CAPPSC[1:0]	Channel 3 input capture prescaler Refer to CH0CAPPSC description
9:8	CH3MS[1:0]	Channel 3 mode selection Same as Output compare mode
7:4	CH2CAPFLT[3:0]	Channel 2 input capture filter control The CI2 input signal can be filtered by digital filter and this bit-field configure the filtering capability. Basic principle of digital filter: continuously sample the CI2 input signal according to f_{SAMP} and record the number of times of the same level of the signal. After reaching the filtering capacity configured by this bit, it is considered to be an effective level. The filtering capability configuration is as follows:

CH2CAPFLT [3:0]	Times	f_{SAMP}
4'b0000	Filter disabled.	
4'b0001	2	f_{CK_TIMER}
4'b0010	4	
4'b0011	8	
4'b0100	6	$f_{DTS}/2$
4'b0101	8	
4'b0110	6	$f_{DTS}/4$
4'b0111	8	
4'b1000	6	$f_{DTS}/8$
4'b1001	8	
4'b1010	5	$f_{DTS}/16$
4'b1011	6	

		4’b1100	8	
		4’b1101	5	f_{DTS}/32
		4’b1110	6	
		4’b1111	8	
3:2	CH2CAPPSC[1:0]	Channel 2 input capture prescaler This bit-field specifies the factor of the prescaler on channel 2 input. The prescaler is reset when CH2EN bit in TIMERx_CHCTL2 register is clear. 00: Prescaler disable, input capture occurs on every channel input edge 01: The input capture occurs on every 2 channel input edges 10: The input capture occurs on every 4 channel input edges 11: The input capture occurs on every 8 channel input edges		
1:0	CH2MS[1:0]	Channel 2 mode selection Same as output compare mode		

Channel control register 2 (TIMERx_CHCTL2)

Address offset: 0x20
Reset value: 0x0000

This register can be accessed by half-word(16-bit) or word(32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Fields	Descriptions
15:14	Reserved	Must be kept at reset value.
12:8	DMATC [4:0]	DMA transfer count This filed defines the number(n) of the register that DMA will access(R/W), n = (DMATC [4:0] +1). DMATC [4:0] is from 5'b0_0000 to 5'b1_0001.
7:5	Reserved	Must be kept at reset value.
4:0	DMATA [4:0]	DMA transfer access start address This filed define the first address for the DMA access the TIMERx_DMATB. When access is done through the TIMERx_DMA address first time, this bit-field specifies the address you just access. And then the second access to the TIMERx_DMATB, you will access the address of start address + 0x4.

DMA transfer buffer register (TIMERx_DMATB)

Address offset: 0x4C
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMATB[15:0]															
rw															

Bits	Fields	Descriptions
15:0	DMATB[15:0]	DMA transfer buffer When a read or write operation is assigned to this register, the register located at the address range (Start Addr + Transfer Timer* 4) will be accessed. The transfer Timer is calculated by hardware, and ranges from 0 to DMATC.

15.3. Basic timer (TIMERx, x=5, 6)

15.3.1. Overview

The basic timer module (Timer5, 6) reference is a 16-bit counter that can be used as an unsigned counter. The basic timer can be configured to generate DMA request and TRGO to DAC.

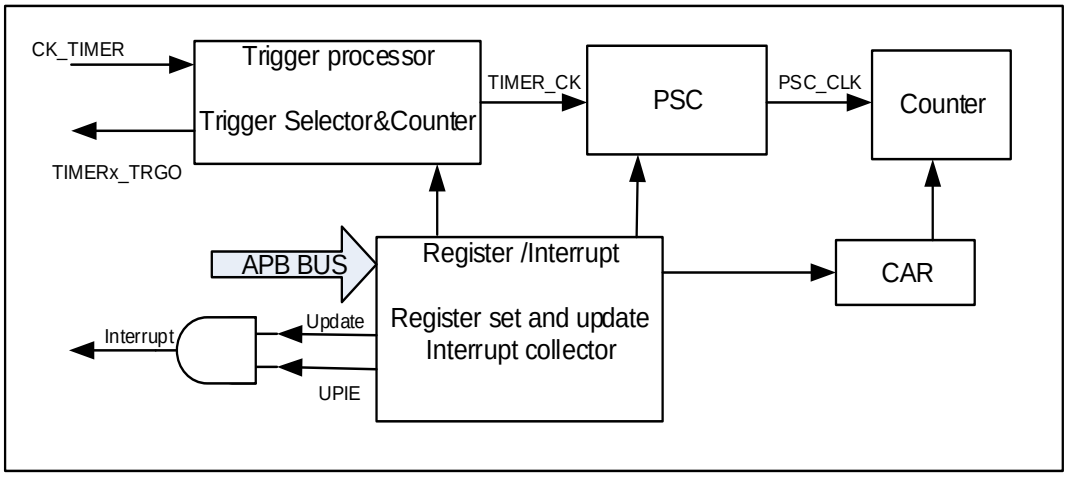
15.3.2. Characteristics

- Counter width: 16-bit.
- Source of count clock is internal clock only.
- Multiple counter modes: count up.
- Programmable prescaler: 16-bit. The factor can be changed ongoing.
- Single pulse mode is supported.
- Auto-reload function.
- Interrupt output or DMA request on update event.

15.3.3. Block diagram

Figure 15-45. Basic timer block diagram provides details on the internal configuration of the basic timer.

Figure 15-45. Basic timer block diagram



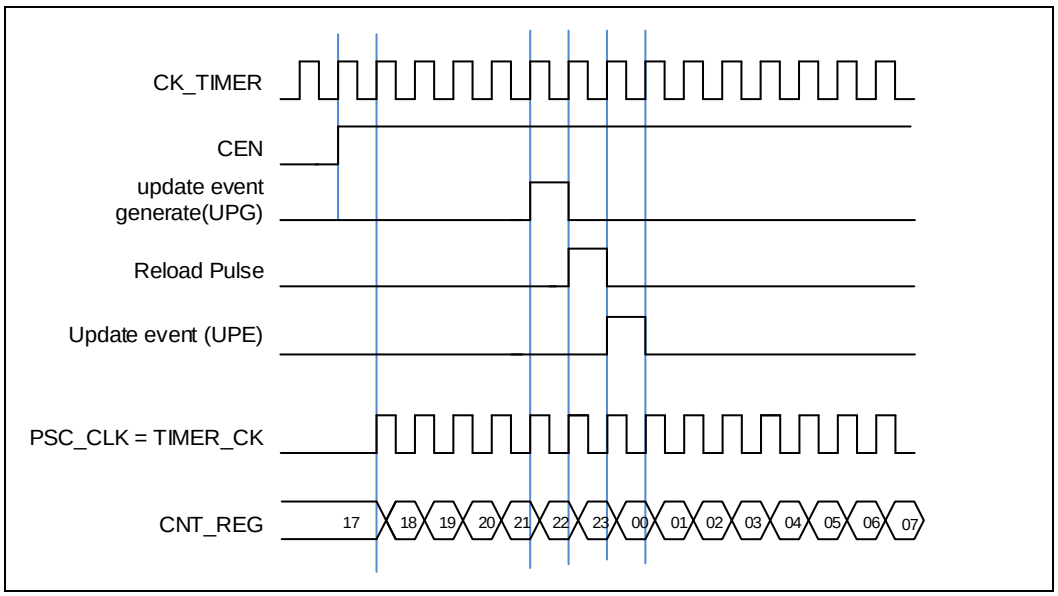
15.3.4. Function overview

Clock source configuration

The basic TIMER can only being clocked by the internal timer clock CK_TIMER, which is from the source named CK_TIMER in RCU

The TIMER_CK, driven counter's prescaler to count, is equal to CK_TIMER used to drive the counter prescaler. When the CEN is set, the CK_TIMER will be divided by PSC value to generate PSC_CLK.

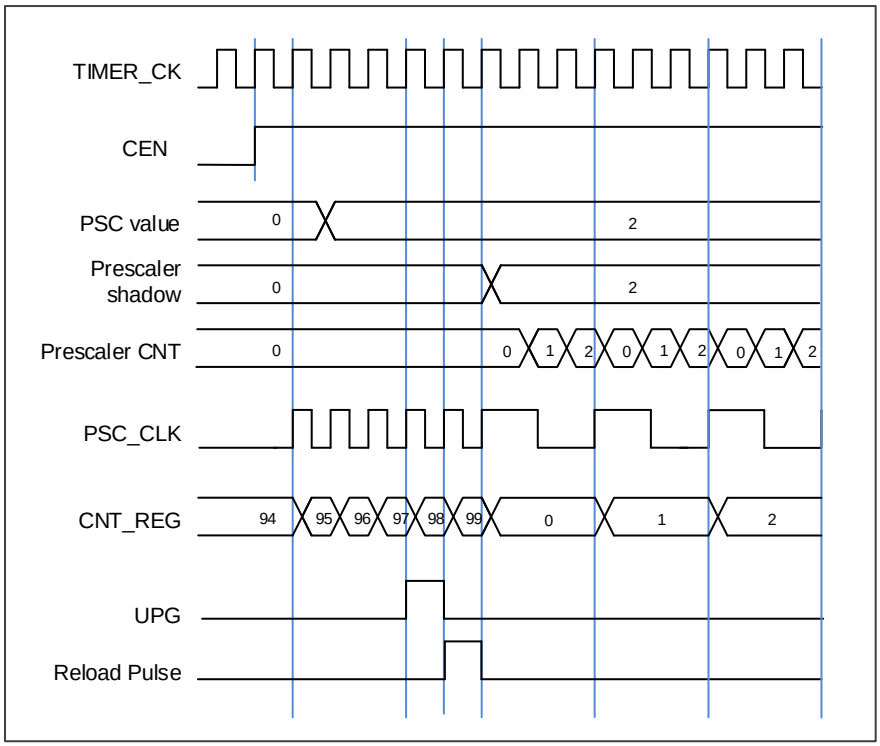
Figure 15-46. Timing chart of internal clock divided by 1



Clock prescaler

The counter clock (PSC_CK) is obtained by the TIMER_CK through the prescaler, and the prescale factor can be configured from 1 to 65536 through the prescaler register (TIMERx_PSC). The new written prescaler value will not take effect until the next update event.

Figure 15-47. Timing chart of PSC value change from 0 to 2



Counter up counting

In this mode, the counter counts up continuously from 0 to the counter-reload value, which is defined in the TIMERx_CAR register, in a count-up direction. Once the counter reaches the counter reload value, the counter will start counting up from 0 again. The update event is generated at each counter overflow.

When the update event is set by the UPG bit in the TIMERx_SWEVG register, the counter value will be initialized to 0 and generates an update event.

If set the UPDIS bit in TIMERx_CTL0 register, the update event is disabled.

When an update event occurs, all the shadow registers (counter auto reload register, prescaler register) are updated.

Figure 15-48. Timing chart of up counting mode, PSC=0/2 and ***Figure 15-49. Timing chart of up counting mode, change TIMERx_CAR ongoing*** show some examples of the counter behavior for different clock prescaler factor when TIMERx_CAR=0x99.

Figure 15-48. Timing chart of up counting mode, PSC=0/2

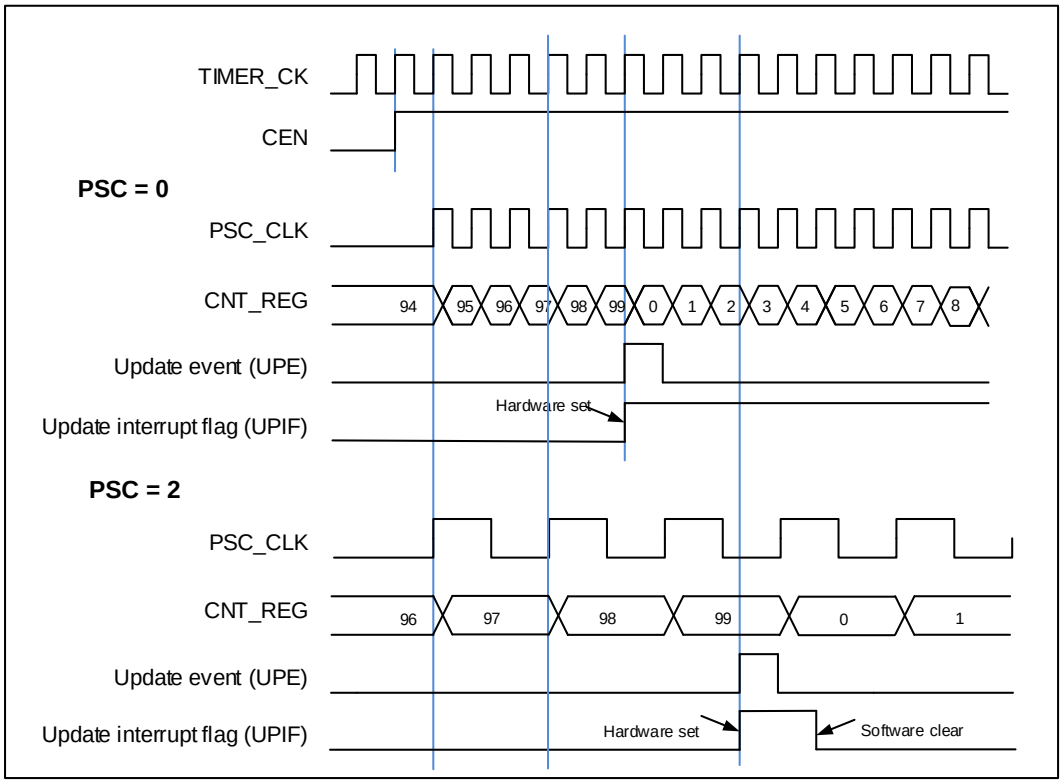


Figure 15-49. Timing chart of up counting mode, change TIMERx_CAR ongoing

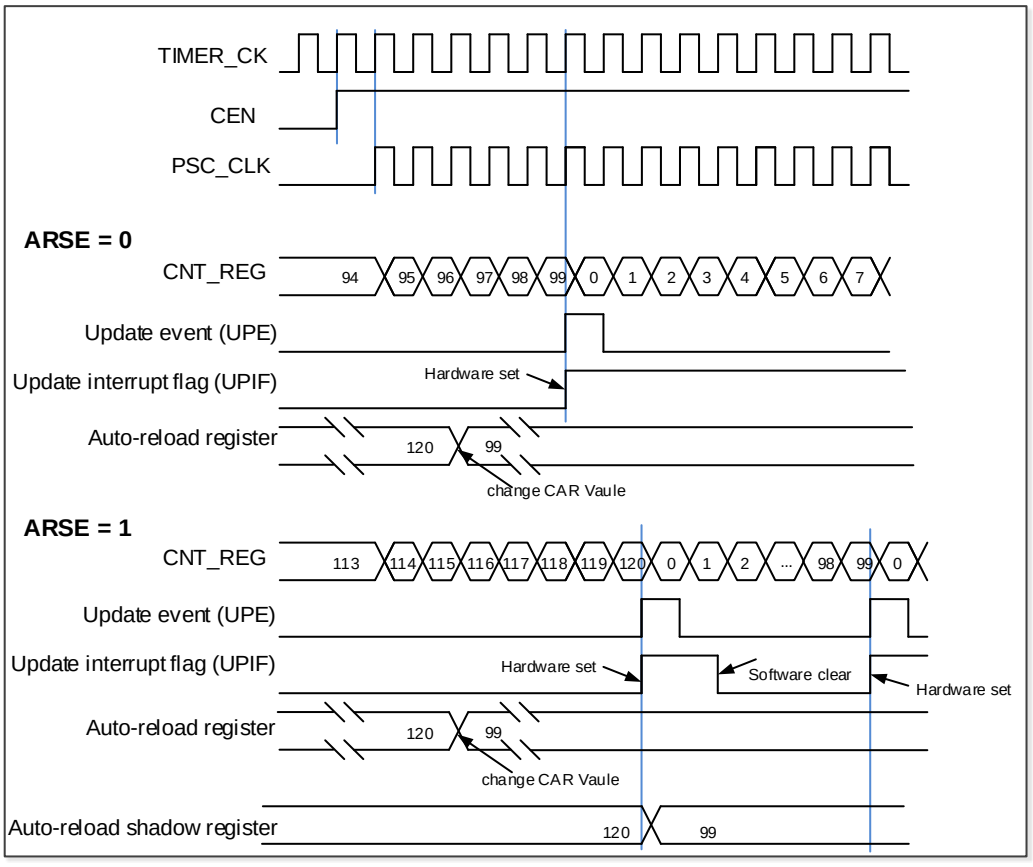

Single pulse mode

Single pulse mode is opposite to the repetitive mode, which can be enabled by setting SPM in TIMERx_CTL0. When you set SPM, the counter will be clear and stop when the next update event.

Once the timer is set to operate in the single pulse mode, it is necessary to set the timer enable bit CEN in the TIMERx_CTL0 register to 1 to enable the counter, then the CEN bit keeps at a high state until the update event occurs or the CEN bit is written to 0 by software. If the CEN bit is cleared to 0 using software, the counter will be stopped and its value held.

Timer debug mode

When the RISC-V core halted, and the TIMERx_HOLD configuration bit in DBG_CTL register set to 1, the TIMERx counter stops.

15.3.5. TIMERx registers(x=5,6)

TIMER5 base address: 0x40001000

TIMER6 base address: 0x40001400

Control register 0 (TIMERx_CTL0)

Address offset: 0x00
Reset value: 0x0000

This register can be accessed by half-word (16-bit) or word (32-bit)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Fields	Descriptions
15:0	CARL[15:0]	Counter auto reload value This bit-filed specifies the auto reload value of the counter. Note: When the timer is configured in input capture mode, this register must be configured a non-zero value (such as 0xFFFF) which is larger than user expected value.

16. Universal synchronous/asynchronous receiver /transmitter (USART)

16.1. Overview

The Universal Synchronous/Asynchronous Receiver/Transmitter (USART) provides a flexible serial data exchange interface. Data frames can be transferred in full duplex or half duplex mode, synchronously or asynchronously through this interface. A programmable baud rate generator divides the UCLK to produce a dedicated baud rate lock for the USART transmitter and receiver.

Besides the standard asynchronous receiver and transmitter mode, the USART implements several other types of serial data exchange modes, such as IrDA (infrared data association) SIR mode, smartcard mode, LIN (local interconnection network) mode, half-duplex mode and synchronous mode. It also supports multiprocessor communication mode, and hardware flow control protocol (CTS/RTS). The data frame can be transferred from LSB or MSB bit.

The USART supports DMA function for high-speed data communication, except UART4.

16.2. Characteristics

- NRZ standard format.
- Asynchronous, full duplex communication.
- Half duplex single wire communication.
- Programmable baud-rate generator.
  - Divided from the peripheral clocks, PCLK2 for USART0, PCLK1 for USART1/2 and UART3/4.
  - Oversampling by 16.
  - Maximum speed up to 6.75 MBits/s (PCLK2 108M and oversampling by 16).
- Fully programmable serial interface characteristics:
  - Even, odd or no-parity bit generation/detection.
  - A data word length can be 8 or 9 bits.
  - 0.5, 1, 1.5 or 2 stop bit generation.
- Transmitter and receiver can be enabled separately.
- Hardware flow control protocol (CTS/RTS).
- DMA request for data buffer access.
- LIN break generation and detection.
- IrDA support.
- Synchronous mode and transmitter clock output for synchronous transmission.
- ISO 7816-3 compliant smartcard interface.
  - Character mode (T=0).

- Multiprocessor communication.
  - Enter into mute mode if address match does not occur.
  - Wake up from mute mode by idle frame or address match detection.
- Various status flags:
  - Flags for transfer detection: receive buffer not empty (RBNE), transmit buffer empty (TBE), transfer complete (TC).
  - Flags for error detection: overrun error (ORERR), noise error (NERR), frame error (FERR) and parity error (PERR).
  - Flag for hardware flow control: CTS changes (CTSF).
  - Flag for LIN mode: LIN break detected (LBDF).
  - Flag for multiprocessor communication: IDLE frame detected (IDLEF).
  - Interrupt occurs at these events when the corresponding interrupt enable bits are set.

While USART0/1/2 is fully implemented, UART3/4 is only partially implemented with the following features not supported.

- Smartcard mode.
- Synchronous mode.
- Hardware flow control protocol (CTS/RTS).

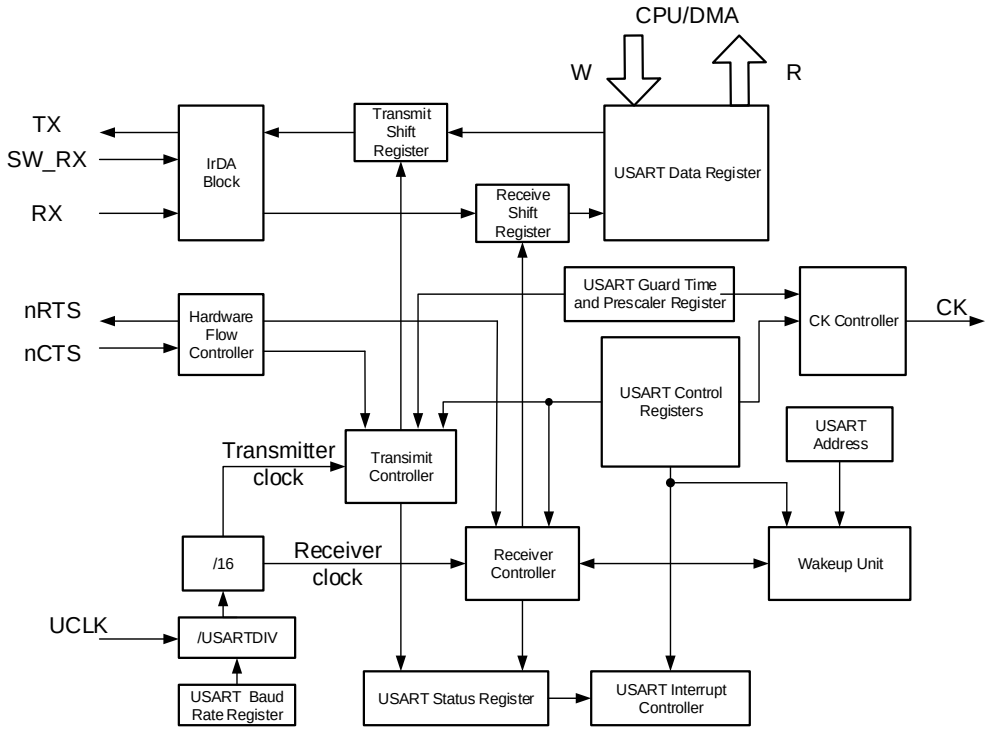
16.3. Function overview

The interface is externally connected to another device by the main pins listed in ***Table 16-1. Description of USART important pins***.

Table 16-1. Description of USART important pins

Pin	Type	Description
RX	Input	Receive data
TX	Output I/O (single-wire/Smartcard mode)	Transmit data. High level when enabled but nothing to be transmitted
CK	Output	Serial clock for synchronous communication
nCTS	Input	Clear to send in hardware flow control mode
nRTS	Output	Request to send in hardware flow control mode

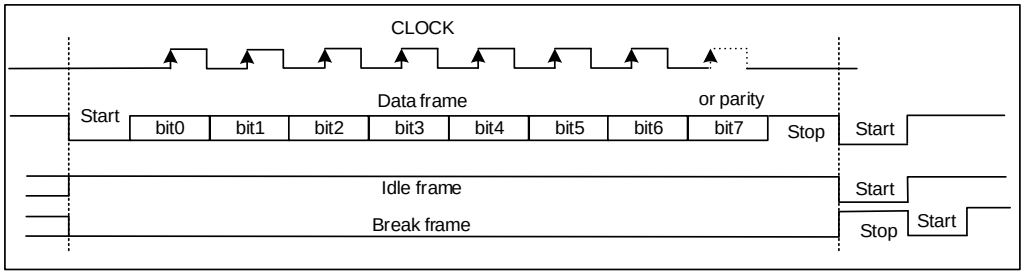
Figure 16-1. USART module block diagram



16.3.1. USART frame format

The USART frame starts with a start bit and ends up with a number of stop bits. The length of the data frame is configured by the WL bit in the USART_CTL0 register. The last data bit can be used as parity check bit by setting the PCEN bit of in USART_CTL0 register. When the WL bit is reset, the parity bit is the 7th bit. When the WL bit is set, the parity bit is the 8th bit. The method of calculating the parity bit is selected by the PM bit in USART_CTL0 register.

Figure 16-2. USART character frame (8 bits data and 1 stop bit)



In transmission and reception, the number of stop bits can be configured by the STB[1:0] bits in the USART_CTL1 register.

Table 16-2. Stop bits configuration

STB[1:0]	stop bit length (bit)	usage description
00	1	default value
01	0.5	Smartcard mode for receiving

STB[1:0]	stop bit length (bit)	usage description
10	2	normal USART and single-wire modes
11	1.5	Smartcard mode for transmitting and receiving

In an idle frame, all the frame bits are logic 1. The frame length is equal to the normal USART frame.

A break frame is configured number of low bits followed by the configured number of stop bits. The transfer speed of a USART frame depends on the frequency of the UCLK, the configuration of the baud rate generator and the oversampling mode.

16.3.2. Baud rate generation

The baud-rate divider is a 16-bit number consisting of a 12-bit integer and a 4-bit fractional part. The number formed by these two values is used by the baud rate generator to determine the bit period. Having a fractional baud-rate divider allows the USART to generate all the standard baud rates.

When oversampled by 16, the baud-rate divider (USARTDIV) has the following relationship with the peripheral clock:

$$\text{USARTDIV} = \frac{\text{UCLK}}{16 \times \text{Baud Rate}} \quad (16\text{-}1)$$

1. Get USARTDIV by caculating the value of USART_BUAD:
   If USART_BUAD=0x21D, then INTDIV=33 (0x21), FRADIV=13 (0xD).
   USARTDIV=33+13/16=33.81.
2. Get the value of USART_BUAD by calculating the value of USARTDIV:
   If USARTDIV=30.37, then INTDIV=30 (0x1E).
   16*0.37=5.92, the nearest integer is 6, so FRADIV=6 (0x6).
   USART_BUAD=0x1E6.

Note: If the roundness of FRADIV is 16 (overflow), the carry must be added to the integer part.

16.3.3. USART transmitter

If the transmit enable bit (TEN) in USART_CTL0 register is set, when the transmit data buffer is not empty, the transmitter shifts out the transmit data frame through the TX pin. Clock pulses can output through the CK pin.

After the TEN bit is set, an idle frame will be sent. The TEN bit should not be cleared while the transmission is ongoing.

After power on, the TBE bit is high by default. Data can be written to the USART_DATA when the TBE bit of the USART_STAT register is asserted. The TBE bit is cleared by writing to the USART_DATA register and it is set by hardware after the data is put into the transmit shift

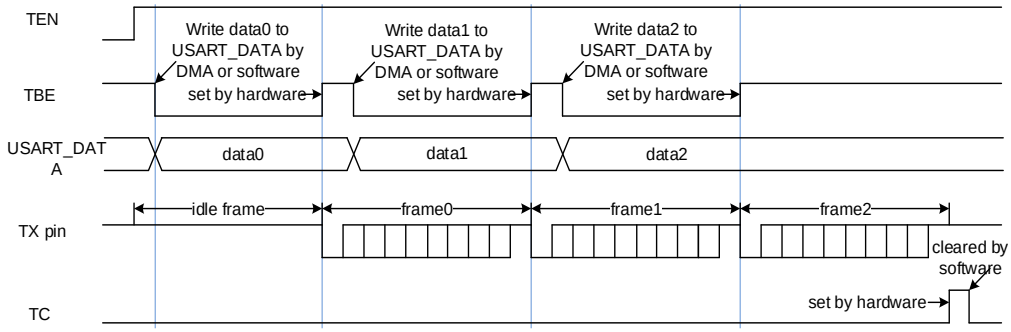
register. If a data is written to the USART_DATA register while a transmission is ongoing, it will be firstly stored in the transmit buffer, and transferred to the transmit shift register after the current transmission is done. If a data is written to the USART_DATA register while no transmission is ongoing, the TBE bit will be cleared and set soon, because the data will be transferred to the transmit shift register immediately.

If a frame is transmitted and the TBE bit is asserted, the TC bit of the USART_STAT register will be set. An interrupt will be generated if the corresponding interrupt enable bit (TCIE) is set in the USART_CTL0 register.

The USART transmit procedure is shown in ***Figure 16-3. USART transmit procedure***. The software operating process is as follows:

1. Write the WL bit in USART_CTL0 to set the data bits length.
2. Set the STB[1:0] bits in USART_CTL1 to configure the number of stop bits.
3. Enable DMA (DENT bit) in USART_CTL2 if multibuffer communication is selected.
4. Set the baud rate in USART_BAUD.
5. Set the TEN bit in USART_CTL0.
6. Set the UEN bit in USART_CTL0 to enable the USART
7. Wait for the TBE to be asserted.
8. Write the data to the USART_DATA register.
9. Repeat step7-8 for each data, if DMA is not enabled.
10. Wait until TC=1 to finish.

Figure 16-3. USART transmit procedure



It is necessary to wait for the TC bit to be asserted before disabling the USART or entering the power saving mode. This bit can be cleared by a software sequence: reading the USART_STAT register and then writing the USART_DATA register. If the multibuffer communication is selected (DENT=1), this bit can also be cleared by writing 0 directly.

16.3.4. USART receiver

After power on, the USART receiver can be enabled by the follow procedure:

1. Write the WL bit in USART_CTL0 to set the data bits length.
2. Set the STB[1:0] bits in USART_CTL1.
3. Enable DMA (DENR bit) in USART_CTL2 if multibuffer communication is selected.
4. Set the baud rate in USART_BAUD.

5. Set the REN bit in USART_CTL0.
6. Set the UEN bit in USART_CTL0 to enable the USART.

After being enabled, the receiver receives a bit stream after a valid start pulse has been detected. Detection on noisy error, parity error, frame error and overrun error is performed during the reception of a frame.

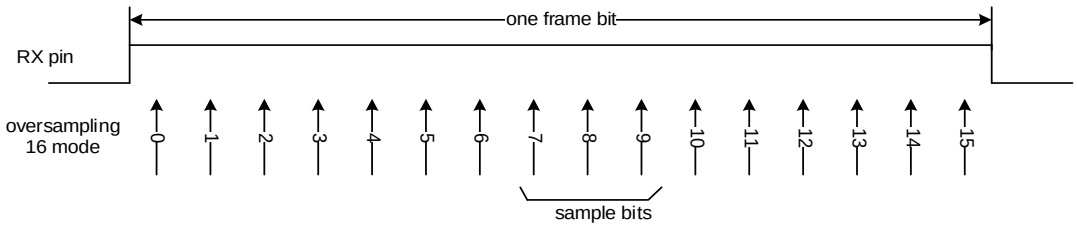
When a frame is received, the RBNE bit in USART_STAT is asserted, an interrupt is generated if the corresponding interrupt enable bit (RBNEIE) is set in the USART_CTL0 register. The status of the reception are stored in the USART_STAT register.

The software can get the received data by reading the USART_DATA register directly, or through DMA. The RBNE bit is cleared by a read operation on the USART_DATA register, whatever it is performed by software directly, or through DMA.

The REN bit should not be disabled when reception is ongoing, or the current frame will be lost.

By default, the receiver gets three samples to evaluate the value of a frame bit. While in the oversampling 16 mode, the 7th, 8th, and 9th samples are used. If two or more samples of a frame bit is 0, the frame bit is confirmed as a 0, else 1. If the value of the three samples of any bit are not the same, whatever it is a start bit, data bit, parity bit or stop bit, a noisy error (NERR) will be generated for the frame. An interrupt will be generated, if the receive DMA is enabled and the ERRIE bit in USART_CTL2 register is set.

Figure 16-4. Receiving a frame bit by oversampling method



If the parity check function is enabled by setting the PCEN bit in the USART_CTL0 register, the receiver calculates the expected parity value while receiving a frame. The received parity bit will be compared with this expected value. If they are not the same, the parity error (PERR) bit in USART_STAT register will be set. An interrupt is generated, if the PERRIE bit in USART_CTL0 register is set.

If the RX pin is evaluated as 0 during a stop bit, the frame error (FERR) bit in USART_STAT register will be set. An interrupt is generated, If the receive DMA is enabled and the ERRIE bit in USART_CTL2 register is set.

When a frame is received, if the RBNE bit is not cleared yet, the last frame will not be stored in the receive data buffer. The overrun error (ORERR) bit in USART_STAT register will be set. An interrupt is generated, if the receive DMA is enabled and the ERRIE bit in USART_CTL2 register is set, or if the RBNEIE is set.

If a noise error (NERR), parity error (PERR), frame error (FERR) or overrun error (ORERR)

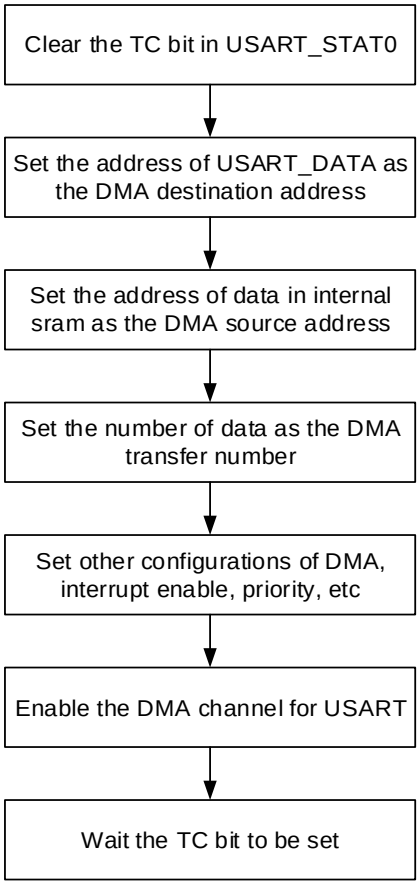
is generated during a receiving process, then NERR, PERR, FERR or ORERR will be set at same time with RBNE. If DMA is disabled, the software needs to check whether the RBNE interrupt is caused by noise error, parity error, framing error or overflow error when the RBNE interrupt occurs.

16.3.5. Use DMA for data buffer access

To reduce the burden of the processor, DMA can be used to access the transmitting and receiving data buffer. The DENT bit in USART_CTL2 is used to enable the DMA transmission, and the DENR bit in USART_CTL2 is used to enable the DMA reception.

When DMA is used for USART transmission, DMA transfers data from internal SRAM to the transmit data buffer of the USART. The configuration steps are shown in ***Figure 16-5. Configuration steps when using DMA for USART transmission***.

Figure 16-5. Configuration steps when using DMA for USART transmission

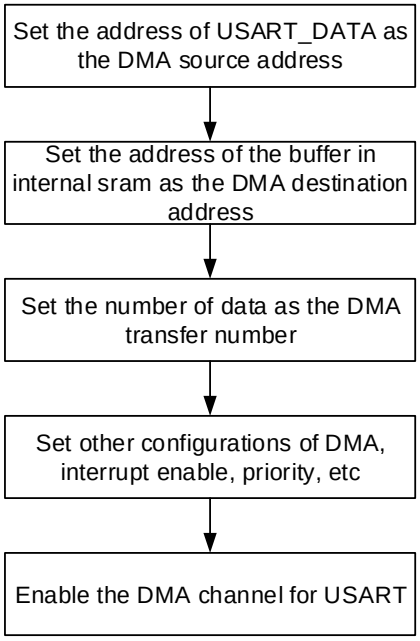


After all of the data frames are transmitted, the TC bit in USART_STAT is set. An interrupt occurs if the TCIE bit in USART_CTL0 is set.

When DMA is used for USART reception, DMA transfers data from the receive data buffer of the USART to the internal SRAM. The configuration steps are shown in ***Figure 16-6. Configuration steps when using DMA for USART reception***. If the ERRIE bit in USART_CTL2 is set, interrupts can be generated by the Error status bits (FERR, ORERR

and NERR) in USART_STAT.

Figure 16-6. Configuration steps when using DMA for USART reception

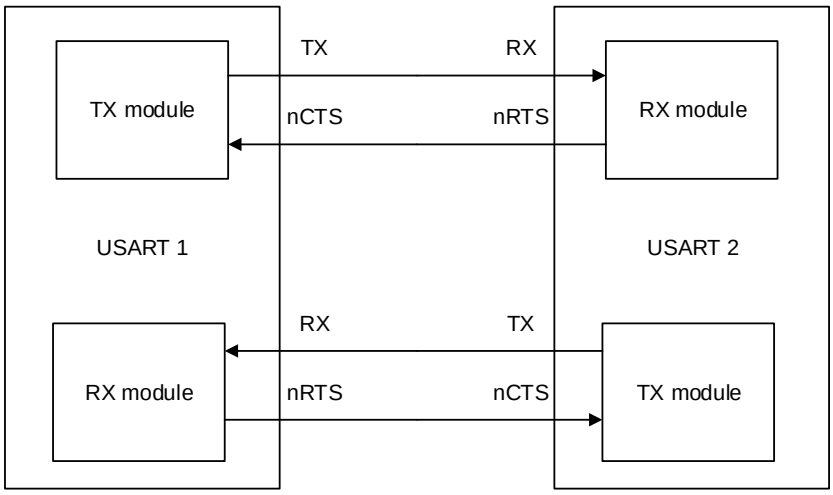


When the number of the data received by USART reaches the DMA transfer number, an end of transfer interrupt will be generated in the DMA module.

16.3.6. Hardware flow control

The hardware flow control function is realized by the nCTS and nRTS pins. The RTS flow control is enabled by writing ‘1’ to the RTSEN bit in USART_CTL2 and the CTS flow control is enabled by writing ‘1’ to the CTSEN bit in USART_CTL2.

Figure 16-7. Hardware flow control between two USARTs



RTS flow control

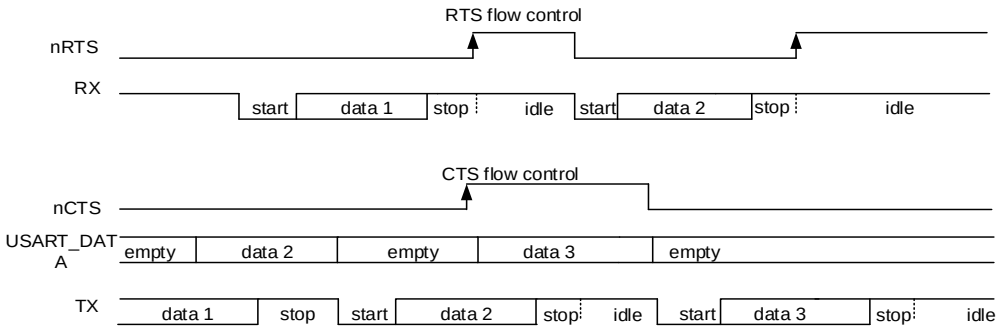
The USART receiver outputs the nRTS, which reflects the status of the receive buffer. When

data frame is received, the nRTS signal goes high to prevent the transmitter from sending next frame. The nRTS signal keeps high when the receive buffer is full, and can be cleared by reading the USART_DATA register.

CTS flow control

The USART transmitter monitors the nCTS input pin to decide whether a data frame can be transmitted. If the TBE bit in USART_STAT is '0' and the nCTS signal is low, the transmitter transmits the data frame. When the nCTS signal goes high during a transmission, the transmitter stops after the current transmission is accomplished.

Figure 16-8. Hardware flow control



If the CTS flow control is enabled, the CTSF bit in USART_STAT is set when the nCTS pin toggles. An interrupt is generated if the CTSIE bit in USART_CTL2 is set.

16.3.7. Multi-processor communication

In multiprocessor communication, several USARTs are connected as a network. It will be a big burden for a device to monitor all of the messages on the RX pin. To reduce the burden of a device, software can put an USART module into a mute mode by setting the RWU bit in USART_CTL0 register.

If a USART is in mute mode, all of the receive status bits cannot be set. Software can wake up the USART by clearing the RWU bit.

The USART can also be woken up by hardware by one of the two methods: idle frame method and address match method.

The idle frame wake up method is selected by default. When an idle frame is detected on the RX pin, the hardware clears the RWU bit and exits the mute mode. When it is woken up by an idle frame, the IDLEF bit in USART_STAT will not be set.

When the WM bit of in USART_CTL0 register is set, the MSB bit of a frame is detected as the address flag. If the address flag is high, the frame is treated as an address frame. If the address flag is low, the frame is treated as a data frame. If the LSB 4 bits of an address frame are the same as the ADDR[3:0] bits in the USART_CTL1 register, the hardware will clear the RWU bit and exits the mute mode. The RBNE bit will be set when the frame that wakes up

the USART. The status bits are available in the USART_STAT register. If the LSB 4 bits of an address frame differ from the ADDR[3:0] bits in the USART_CTL1 register, the hardware sets the RWU bit and enters mute mode automatically. In this situation, the RBNE bit is not set.

If the address match method is selected, the receiver does not check the parity value of an address frame by default. If the PCEN bit in USART_CTL0 is set, the MSB bit will be checked as the parity bit, and the bit preceding the MSB bit is detected as the address bit.

16.3.8. LIN mode

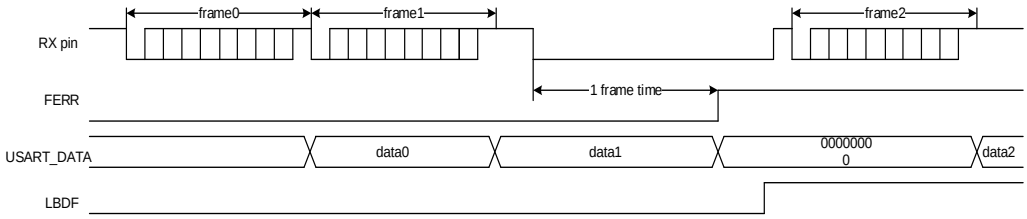
The local interconnection network mode is enabled by setting the LMEN bit in USART_CTL1. The CKEN, WL, STB[1:0] bits in USART_CTL1 and the SCEN, HDEN, IREN bits in USART_CTL2 should be cleared in LIN mode.

When transmitting a normal data frame, the transmission procedure is the same as the normal USART mode. When the SBKCMD bit in USART_CTL0 is set, the USART transmits 13 ‘0’ bits continuously, followed by 1 stop bit.

The break detection function is totally independent of the normal USART receiver. So a break frame can be detected during the idle state or during a frame. The expected length of a break frame can be selected by configuring LBLEN bit in USART_CTL1. When the RX pin is detected at low state for a time that is equal to or longer than the expected break frame length (10 bits when LBLEN=0, or 11 bits when LBLEN=1), the LBDF in USART_STAT is set. An interrupt occurs if the LBDIE bit in USART_CTL1 is set.

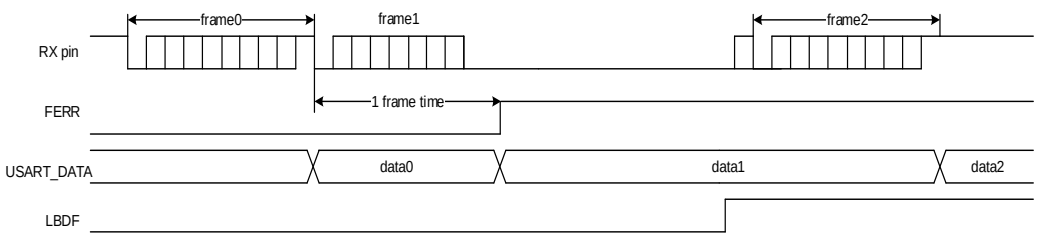
As shown in ***Figure 16-9. Break frame occurs during idle state***, if a break frame occurs during the idle state on the RX pin, the USART receiver will receive an all ‘0’ frame, with an asserted FERR status.

Figure 16-9. Break frame occurs during idle state



As shown in ***Figure 16-10. Break frame occurs during a frame***, if a break frame occurs during a frame on the RX pin, the FERR status will be asserted for the current frame.

Figure 16-10. Break frame occurs during a frame



16.3.9. Synchronous mode

The USART can be used for full-duplex synchronous serial communications only in master mode, by setting the CKEN bit in USART_CTL1. The LMEN bit in USART_CTL1 and SCEN, HDEN, IREN bits in USART_CTL2 should be cleared in synchronous mode. The CK pin is the clock output of the synchronous USART transmitter, and can be only activated when the TEN bit is enabled. No clock pulse will be sent through the CK pin during the transmission of the start bit and stop bit. The CLEN bit in USART_CTL1 can be used to determine whether the clock is output or not during the last (address flag) bit transmission. The CPH bit in USART_CTL1 can be used to determine whether data is captured on the first or the second clock edge. The CPL bit in USART_CTL1 can be used to configure the clock polarity in the USART synchronous idle state.

The CPL, CPH and CLEN bits in USART_CTL1 determine the waveform on the CK pin. Software can only change them when the USART is disabled (UEN=0).

If the REN bit in USART_CTL0 is set, the receiver works differently from the normal USART reception method. The receiver samples the data on the capture edge of the CK pin without any oversampling.

Figure 16-11. Example of USART in synchronous mode

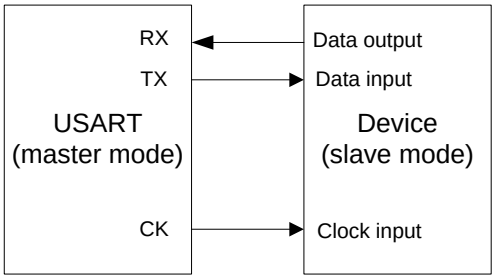


Figure 16-12. 8-bit format USART synchronous waveform (CLEN=1)

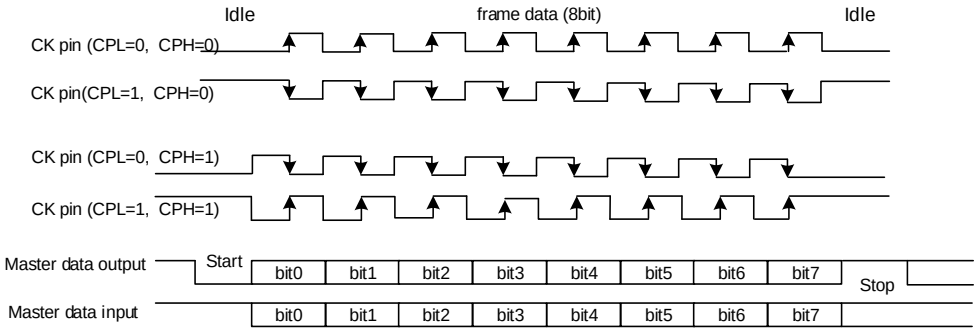


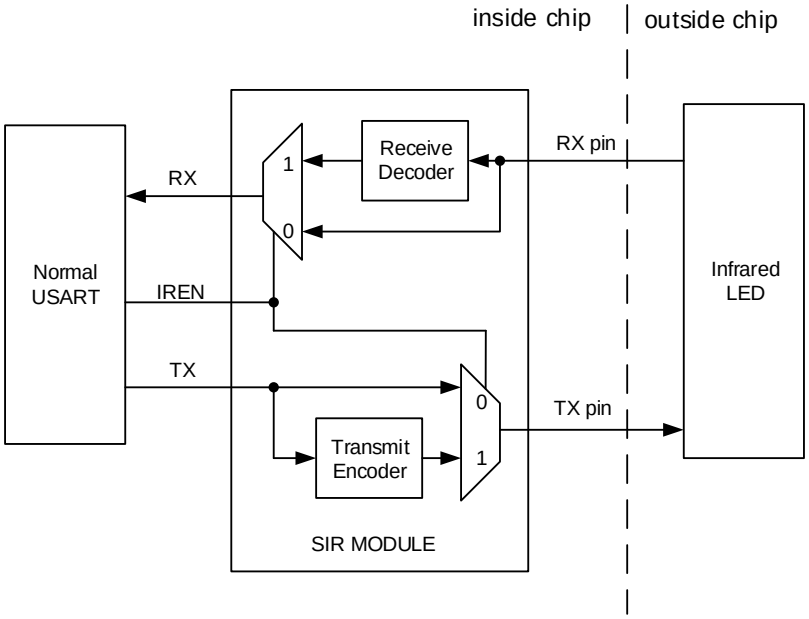
16.3.10. IrDA SIR ENDEC mode

The IrDA mode is enabled by setting the IREN bit in USART_CTL2. The LMEN, STB[1:0], CKEN bits in USART_CTL1 and HDEN, SCEN bits in USART_CTL2 should be cleared in

IrDA mode.

In IrDA mode, the USART transmission data frame is modulated in the SIR transmit quadrature decoder and transmitted to the infrared LED through the TX pin. The SIR receive decoder receives the modulated signal from the infrared LED through the RX pin, and puts the demodulated data frame to the USART receiver. The baud rate should not be larger than 115200 for the quadrature decoder.

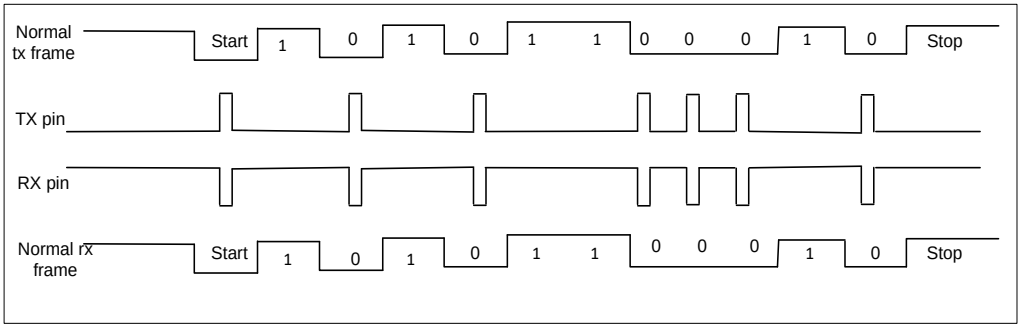
Figure 16-13. IrDA SIR ENDEC module



In IrDA mode, the polarity of the TX pin and RX pin is different. The TX pin is usually at low state, while the RX pin is usually at high state. The IrDA pins keep stable to represent the logic '1', while an infrared light pulse on the IrDA pins (a Return to Zero signal) represents the logic '0'. The pulse width should be 3/16 of a bit period. The IrDA could not detect any pulse if the pulse width is less than 1 PSC clock. While it can detect a pulse by chance if the pulse width is greater than 1 but smaller than 2 times of PSC clock.

Because the IrDA is a half-duplex protocol, the transmission and the reception should not be carried out at the same time in the IrDA SIR ENDEC block.

Figure 16-14. IrDA data modulation



The SIR sub module can work in low power mode by setting the IRLP bit in USART_CTL2.

The transmit quadrature decoder is driven by a low speed clock, which is divided from the PCLK. The division ratio is configured by the PSC[7:0] bits in USART_GP register. The pulse width on the TX pin is 3 cycles of this low speed period. The receiver decoder works in the same manner as the normal IrDA mode.

16.3.11. Half-duplex communication mode

The half-duplex communication mode is enabled by setting the HDEN bit in USART_CTL2. The LMEN, CKEN bits in USART_CTL1 and SCEN, IREN bits in USART_CTL2 should be cleared in half-duplex communication mode.

Only one wire is used in half-duplex mode. The TX and RX pins are connected together internally, and the RX pin is no longer used. The TX pin should be configured as open drain mode and communication conflicts are handled by software.

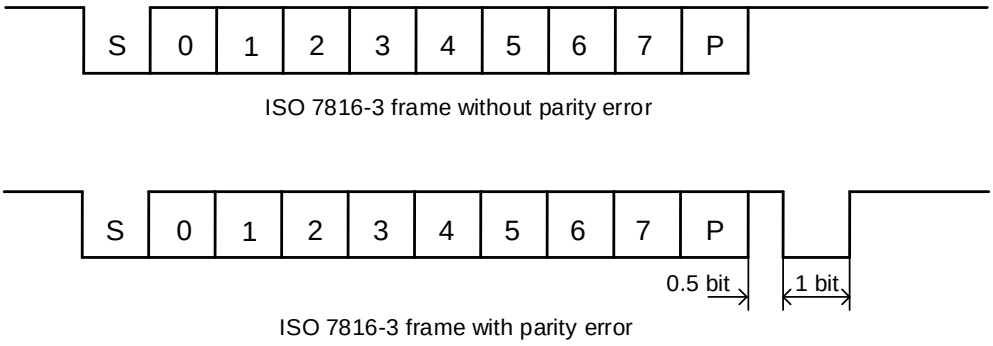
16.3.12. Smartcard (ISO7816-3) mode

The smartcard mode is an asynchronous mode, which is designed to support the ISO7816-3 protocol. The smartcard mode is enabled by setting the SCEN bit in USART_CTL2. The LMEN bit in USART_CTL1 and HDEN, IREN bits in USART_CTL2 should be reset in smartcard mode.

A clock is provided to the external smart card through the CK pin after the CKEN bit is set. The clock is divided from the PCLK. The divide ratio is configured by the PSC[4:0] bits in USART_GP register. The CK pin only provides a clock source to the smartcard.

The smartcard mode is a half-duplex communication protocol. When connected to a smartcard, the TX pin must be configured as open drain, and an external pull-up resistor will be needed, which drives a bidirectional line that is also driven by the smartcard. The data frame consists of 1 start bit, 9 data bits (1 parity bit included) and 1.5 stop bits. The 0.5 stop bit may be configured for a receiver.

Figure 16-15. ISO7816-3 frame format



Character (T=0) mode

Compared to the timing in normal operation, the transmission time from transmit shift register

to the TX pin is delayed by half baud clock, and the TC flag assertion time is delayed by a guard time that is configured by the GUAT[7:0] bits in USART_GP. In smartcard mode, the internal guard time counter starts counting up after the stop bits of the last data frame, and the GUAT[7:0] bits should be configured as the character guard time (CGT) in ISO7816-3 protocol minus 12. The TC status is forced reset while the guard time counter is counting up. When the counter reaches the programmed value TC is asserted high.

During USART transmission, if a parity error event is detected, the smartcard may NACK the current frame by pulling down the TX pin during the last 1 bit time of the stop bits. The USART can automatically resend data according to the protocol. The USART will not take the NACK signal as the start bit.

During USART reception, if the parity error is detected in the current frame, the TX pin is pulled low during the last 1 bit time of the stop bits. This signal is the NACK signal to smart card. Then a frame error occurs in smart card side. The RBNE/receive DMA request is not activated if the received character is erroneous. According to the protocol, the smart card can resend the data. The NACK signal is enabled by setting the NKEN bit in USART_CTL2.

The idle frame and break frame are not applied for the smartcard mode.

16.3.13. USART interrupts

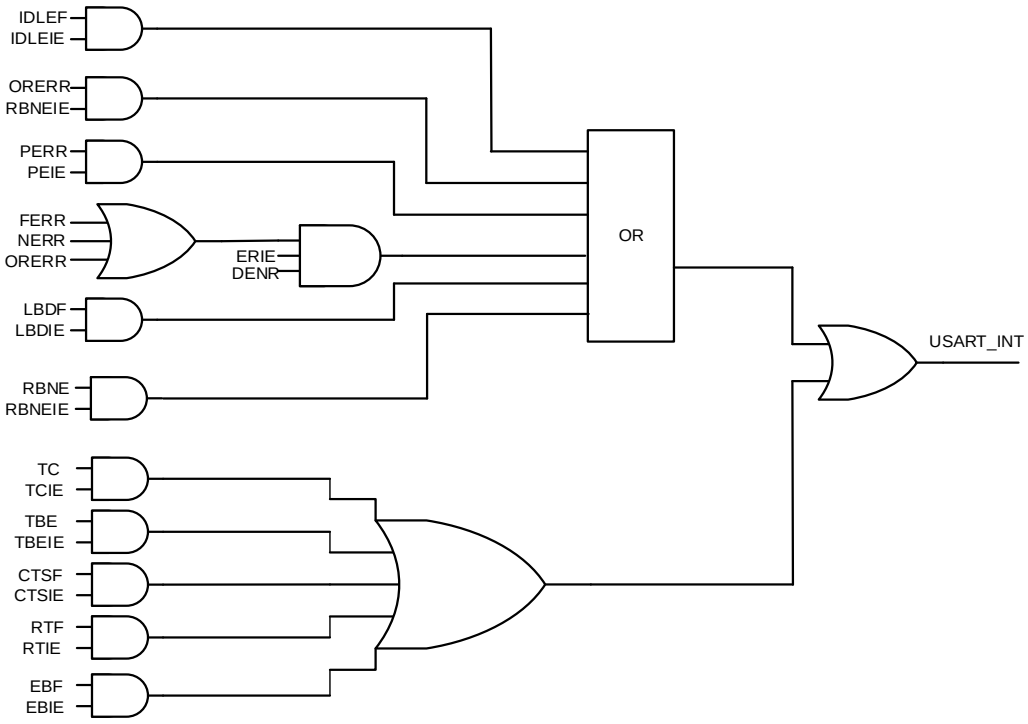
The USART interrupt events and flags are listed in ***Table 16-3. USART interrupt requests***.

Table 16-3. USART interrupt requests

Interrupt event	Event flag	Control register	Enable Control bit
Transmit data buffer empty	TBE	USART_CTL0	TBEIE
CTS toggled flag	CTSF	USART_CTL2	CTSIE
Transmission complete	TC	USART_CTL0	TCIE
Received buff not empty	RBNE	USART_CTL0	RBNEIE
Overrun error	ORERR		
Idle frame	IDLEF	USART_CTL0	IDLEIE
Parity error	PERR	USART_CTL0	PERRIE
Break detected flag in LIN mode	LBDF	USART_CTL1	LBDIE
Reception errors (noise flag, overrun error, framing error) in DMA reception	NERR or ORERR or FERR	USART_CTL2	ERRIE

All of the interrupt events are ORed together before being sent to the interrupt controller, so the USART can only generate a single interrupt request to the controller at any given time. Software can service multiple interrupt events in a single interrupt service routine.

Figure 16-16. USART interrupt mapping diagram



16.4. Register definition

USART0 base address: 0x4001 3800

USART1 base address: 0x4000 4400

USART2 base address: 0x4000 4800

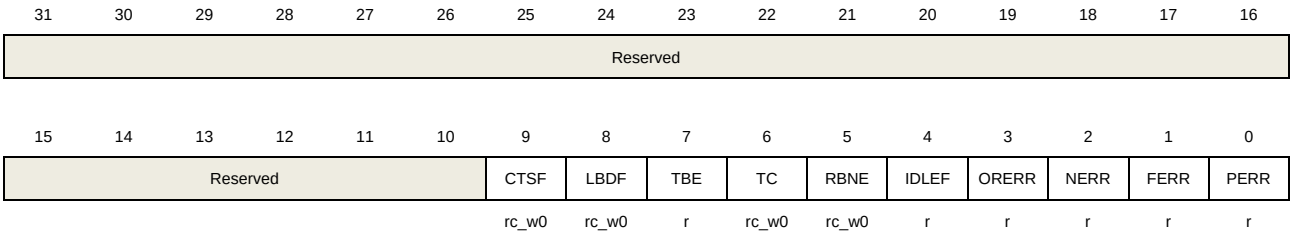
UART3 base address: 0x4000 4C00

UART4 base address: 0x4000 5000

16.4.1. Status register (USART_STAT)

Address offset: 0x00
Reset value: 0x0000 00C0

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:10	Reserved	Must be kept at reset value.
9	CTSF	CTS change flag If CTSEN bit in USART_CTL2 is set, this bit is set by hardware when the nCTS input toggles. An interrupt occurs if the CTSIE bit in USART_CTL2 is set. Software can clear this bit by writing 0 to it. 0: The status of the nCTS line does not change. 1: The status of the nCTS line has changed. This bit is reserved for UART3/4.
8	LBDF	LIN break detected flag This bit is set when LIN break is detected. An interrupt occurs if the LBDIE bit in USART_CTL1 is set. Software can clear this bit by writing 0 to it. 0: The USART does not detect a LIN break. 1: The USART has detected a LIN break.
7	TBE	Transmit data buffer empty This bit is set after power on or when the transmit data has been transferred to the transmit shift register. An interrupt occurs if the TBEIE bit in USART_CTL0 is set. This bit is cleared when the software writes transmit data to the USART_DATA

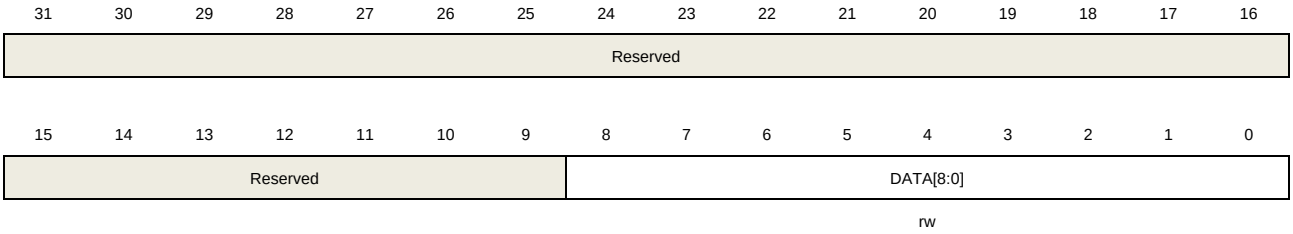
		register. 0: Transmit data buffer is not empty. 1: Transmit data buffer is empty.
6	TC	Transmission complete This bit is set after power on. If the TBE bit has been set, this bit is set when the transmission of current data is complete. An interrupt occurs if the TCIE bit in USART_CTL0 is set. Software can clear this bit by writing 0 to it. 0: Transmission of current data is not complete. 1: Transmission of current data is complete.
5	RBNE	Read data buffer not empty This bit is set when the read data buffer is filled with a data frame, which has been received through the receive shift register. An interrupt occurs if the RBNEIE bit in USART_CTL0 is set. Software can clear this bit by writing 0 to it or by reading the USART_DATA register. 0: Read data buffer is empty. 1: Read data buffer is not empty.
4	IDLEF	IDLE frame detected flag This bit is set when the RX pin has been detected in idle state for a frame time. An interrupt occurs if the IDLEIE bit in USART_CTL0 is set. Software can clear this bit by reading the USART_STAT and USART_DATA registers one by one. 0: The USART module does not detect an IDLE frame. 1: The USART module has detected an IDLE frame.
3	ORERR	Overrun error flag This bit is set if the RBNE is not cleared and a new data frame is received through the receive shift register. An interrupt occurs if RBNEIE bit in USART_CTL0 is set. In multi-processor communication or DMA mode, an interrupt occurs if ERRIE bit in USART_CTL2 is set. Software can clear this bit by reading the USART_STAT and USART_DATA registers one by one. 0: The USART does not detect an overrun error. 1: The USART has detected an overrun error.
2	NERR	Noise error flag This bit is set if the USART detects noise on the RX pin when receiving a frame. An interrupt occurs if the ERRIE bit in USART_CTL2 is set. Software can clear this bit by reading the USART_STAT and USART_DATA registers one by one. 0: The USART does not detect a noise error. 1: The USART has detected a noise error.

1	FERR	Frame error flag This bit is set when the RX pin is detected low during the stop bits of a receive frame. An interrupt occurs if the ERRIE bit in USART_CTL2 is set. Software can clear this bit by reading the USART_STAT and USART_DATA registers one by one. 0: The USART does not detect a framing error. 1: The USART has detected a framing error.
0	PERR	Parity error flag This bit is set when the parity bit of a receive frame does not match the expected parity value. An interrupt occurs if the PERRIE bit in USART_CTL0 is set. Software can clear this bit in the sequence: read the USART_STAT register, and then read or write the USART_DATA register. 0: The USART does not detect a parity error. 1: The USART has detected a parity error.

16.4.2. Data register (USART_DATA)

Address offset: 0x04
Reset value: Undefined

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:9	Reserved	Must be kept at reset value.
8:0	DATA[8:0]	Transmitted or received data value Software can write these bits to update the transmitted data or read these bits to get the received data. If the parity check function is enabled, when transmitted data is written to this register, the MSB bit (bit 7 or bit 8 depending on the WL bit in USART_CTL0) will be replaced by the parity bit.

16.4.3. Baud rate register (USART_BAUD)

Address offset: 0x08
Reset value: 0x0000 0000

The software must not write this register when the USART is enabled (UEN=1).

This register has to be accessed by word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved

rw												rw			

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:4	INTDIV[11:0]	Integer part of baud-rate divider.
3:0	FRADIV[3:0]	Fraction part of baud-rate divider.

16.4.4. Control register 0 (USART_CTL0)

Address offset: 0x0C

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved

		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits	Fields	Descriptions
31:14	Reserved	Must be kept at reset value.
13	UEN	USART enable 0: USART disabled 1: USART enabled
12	WL	Word length 0: 8 data bits 1: 9 data bits
11	WM	Wakeup method in mute mode 0: Wake up by idle frame. 1: Wake up by address match.
10	PCEN	Parity check function enable 0: Parity check function disabled. 1: Parity check function enabled.

9	PM	Parity mode 0: Even parity 1: Odd parity
8	PERRIE	Parity error interrupt enable If this bit is set, an interrupt occurs when the PERR bit in USART_STAT is set. 0: Parity error interrupt is disabled. 1: Parity error interrupt is enabled.
7	TBEIE	Transmitter buffer empty interrupt enable If this bit is set, an interrupt occurs when the TBE bit in USART_STAT is set. 0: Transmitter buffer empty interrupt is disabled. 1: Transmitter buffer empty interrupt is enabled.
6	TCIE	Transmission complete interrupt enable If this bit is set, an interrupt occurs when the TC bit in USART_STAT is set. 0: Transmission complete interrupt is disabled. 1: Transmission complete interrupt is enabled.
5	RBNEIE	Read data buffer not empty interrupt and overrun error interrupt enable If this bit is set, an interrupt occurs when the RBNE bit or the ORERR bit in USART_STAT is set. 0: Read data register not empty interrupt and overrun error interrupt disabled. 1: Read data register not empty interrupt and overrun error interrupt enabled.
4	IDLEIE	IDLE line detected interrupt enable If this bit is set, an interrupt occurs when the IDLEF bit in USART_STAT is set. 0: IDLE line detected interrupt disabled. 1: IDLE line detected interrupt enabled.
3	TEN	Transmitter enable 0: Transmitter is disabled. 1: Transmitter is enabled.
2	REN	Receiver enable 0: Receiver is disabled. 1: Receiver is enabled.
1	RWU	Receiver wakes up from mute mode. Software can set this bit to make the USART work in mute mode and clear this bit to wake up the USART. If it is configured to wake up by idle frame (WM=0), this bit can be cleared by hardware when an idle frame has been detected. If it is configured to wake up by address matching (WM=1), this bit can be cleared by hardware when receiving an address match frame or set by hardware when receiving an address mismatch frame. 0: Receiver in active mode.

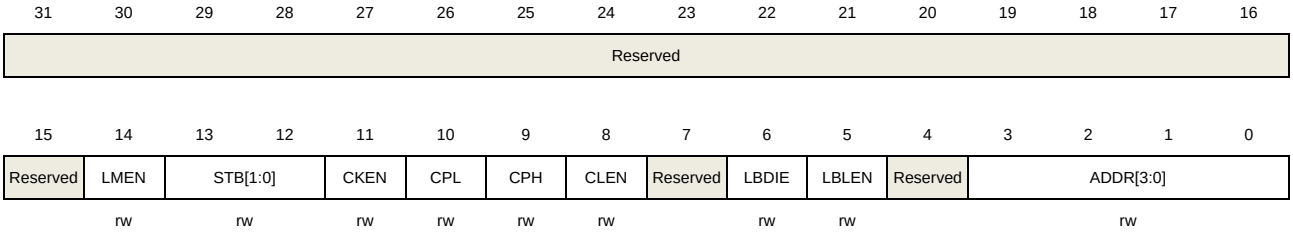
		1: Receiver in mute mode.
0	SBKCMD	Send break command Software can set this bit to send a break frame. Hardware clears this bit automatically when the break frame has been transmitted. 0: Do not transmit a break frame. 1: Transmit a break frame.

16.4.5. Control register 1 (USART_CTL1)

Address offset: 0x10

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:15	Reserved	Must be kept at reset value.
14	LMEN	LIN mode enable 0: LIN mode disabled 1: LIN mode enabled This bit field cannot be written when the USART is enabled (UEN=1).
13:12	STB[1:0]	Stop bits length 00: 1 stop bit 01: 0.5 stop bits 10: 2 stop bits 11: 1.5 stop bits This bit field cannot be written when the USART is enabled (UEN=1). Only 1 stop bit and 2 stop bits are available for UART3/4.
11	CKEN	CK pin enable 0: CK pin disabled 1: CK pin enabled This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
10	CPL	CK polarity This bit specifies the polarity of the CK pin in synchronous mode. 0: The CK pin is in low state when the USART is in idle state.

		1: The CK pin is in high state when the USART is in idle state. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
9	CPH	CK phase This bit specifies the phase of the CK pin in synchronous mode. 0: The capture edge of the LSB bit is the first edge of CK pin. 1: The capture edge of the LSB bit is the second edge of CK pin. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
8	CLEN	CK length This bit specifies the length of the CK signal in synchronous mode. 0: There are 7 CK pulses for an 8 bit frame and 8 CK pulses for a 9 bit frame. 1: There are 8 CK pulses for an 8 bit frame and 9 CK pulses for a 9 bit frame. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
7	Reserved	Must be kept at reset value.
6	LBDIE	LIN break detected interrupt enable If this bit is set, an interrupt occurs when the LBDF bit in USART_STAT is set. 0: LIN break detected interrupt is disabled. 1: LIN break detected interrupt is enabled.
5	LBLEN	LIN break frame length This bit specifies the length of a LIN break frame. 0: 10 bits 1: 11 bits This bit field cannot be written when the USART is enabled (UEN=1).
4	Reserved	Must be kept at reset value.
3:0	ADDR[3:0]	Address of the USART If it is configured toIn wake up by address matching (WM=1), the USART enters mute mode when the LSB 4 bits of a received frame do not equal the ADDR[3:0] bits, and wakes up when the LSB 4 bits of a received frame equal the ADDR[3:0] bits.

16.4.6. Control register 2 (USART_CTL2)

Address offset: 0x14

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved					CTSIE	CTSEN	RTSEN	DENT	DENR	SCEN	NKEN	HDEN	IRLP	IREN	ERRIE
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits	Fields	Descriptions
31:11	Reserved	Must be kept at reset value.
10	CTSIE	CTS interrupt enable If this bit is set, an interrupt occurs when the CTSF bit in USART_STAT is set. 0: CTS interrupt disabled. 1: CTS interrupt enabled. This bit is reserved for UART3/4.
9	CTSEN	CTS enable This bit enables the CTS hardware flow control function. 0: CTS hardware flow control disabled. 1: CTS hardware flow control enabled. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
8	RTSEN	RTS enable This bit enables the RTS hardware flow control function. 0: RTS hardware flow control disabled. 1: RTS hardware flow control enabled. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
7	DENT	DMA request enable for transmission 0: DMA request is disabled for transmission. 1: DMA request is enabled for transmission.
6	DENR	DMA request enable for reception 0: DMA request is disabled for reception. 1: DMA request is enabled for reception.
5	SCEN	Smartcard mode enable This bit enables the smartcard work mode. 0: Smartcard mode disabled. 1: Smartcard mode enabled. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
4	NKEN	NACK enable in smartcard mode This bit enables the NACK transmission when parity error occurs in smartcard mode. 0: Disable NACK transmission.

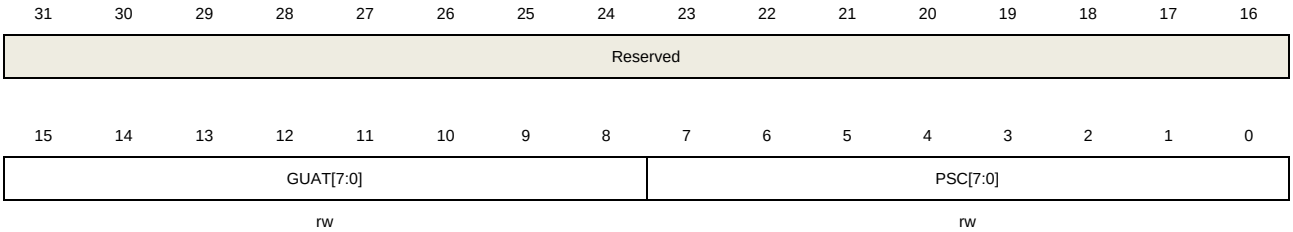
		1: Enable NACK transmission. This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved for UART3/4.
3	HDEN	Half-duplex enable This bit enables the half-duplex USART mode. 0: Half duplex mode is disabled. 1: Half duplex mode is enabled. This bit field cannot be written when the USART is enabled (UEN=1).
2	IRLP	IrDA low-power This bit selects low-power mode of IrDA mode. 0: Normal mode 1: Low-power mode This bit field cannot be written when the USART is enabled (UEN=1).
1	IREN	IrDA mode enable This bit enables the IrDA mode of USART. 0: IrDA disabled 1: IrDA enabled This bit field cannot be written when the USART is enabled (UEN=1). This bit is reserved in USART1.
0	ERRIE	Error interrupt enable When DMA request for reception is enabled (DENR=1), if this bit is set, an interrupt occurs when any one of the FERR, ORERR and NERR bits in USART_STAT is set. 0: Error interrupt disabled 1: Error interrupt enabled

16.4.7. Guard time and prescaler register (USART_GP)

Address offset: 0x18

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit).



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:8	GUAT[7:0]	Guard time value in Smartcard mode

		TC flag assertion time is delayed by GUAT[7:0] baud clock cycles. This bit field cannot be written when the USART is enabled (UEN=1). These bits are reserved for UART3/4.
7:0	PSC[7:0]	When the USART IrDA low-power mode is enabled, these bits specify the division factor that is used to divide the peripheral clock (PCLK1/PCLK2) to generate the low-power frequency. 00000000: Reserved - never program this value. 00000001: Divided by 1. 00000010: Divided by 2. ... 11111111: Divided by 255. When the USART works in IrDA normal mode, these bits must be set to 00000001. When the USART smartcard mode is enabled, the PSC [4:0] bits specify the division factor that is used to divide the peripheral clock (APB1/APB2) to generate the smartcard clock (CK). The actual division factor is twice as the PSC [4:0] value. 00000: Reserved - never program this value. 00001: Divided by 2. 00010: Divided by 4. ... 11111: Divided by 62. The PSC [7:5] bits are reserved in smartcard mode. This bit field cannot be written when the USART is enabled (UEN=1).

17. Inter-integrated circuit interface (I2C)

17.1. Overview

The I2C (inter-integrated circuit) module provides an I2C interface which is an industry standard two-line serial interface for MCU to communicate with external I2C interface. I2C bus uses two serial lines: a serial data line, SDA, and a serial clock line, SCL.

The I2C interface implements standard I2C protocol with standard-mode, fast-mode and fast-mode-plus as well as CRC calculation and checking, SMBus (system management bus) and PMBus (power management bus). It also supports multi-master I2C bus. The I2C interface provides DMA mode for users to reduce CPU overload.

17.2. Characteristics

- Parallel-bus to I2C-bus protocol conversion and interface.
- Both master and slave functions with the same interface.
- Bi-directional data transfer between master and slave.
- Supports 7-bit and 10-bit addressing and General Call Addressing.
- Multi-master capability.
- Supports standard-mode (up to 100 kHz), fast-mode (up to 400 kHz) and fast-mode-plus (up to 1MHz).
- Configurable SCL stretching in slave mode.
- Supports DMA mode.
- SMBus 2.0 and PMBus compatible.
- 2 Interrupts: one for successful byte transmission and the other for error event.
- Optional PEC (Packet Error Checking) generation and check.

17.3. Function overview

Figure 17-1. I2C module block diagram below provides details of the internal configuration of the I2C interface.

Figure 17-1. I2C module block diagram

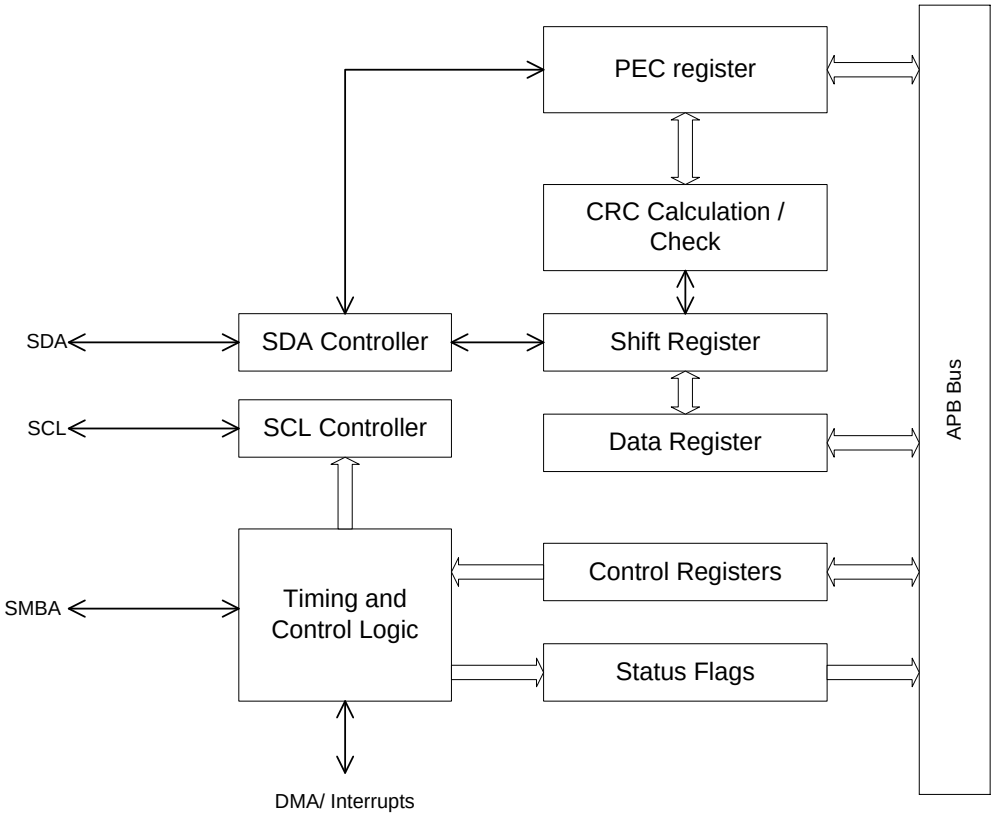


Table 17-1. Definition of I2C-bus terminology (refer to the I2C specification of Philips semiconductors)

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by a master
Multi-master	More than one master can attempt to control the bus at the same time without corrupting the message
Synchronization	Procedure to synchronize the clock signals of two or more devices
Arbitration	Procedure to ensure that, if more than one master tries to control the bus simultaneously, only one is allowed to do so and the winning master's message is not corrupted

17.3.1. SDA and SCL lines

The I2C module has two external lines, the serial data SDA and serial clock SCL lines. The two wires carry information between the devices connected to the bus.

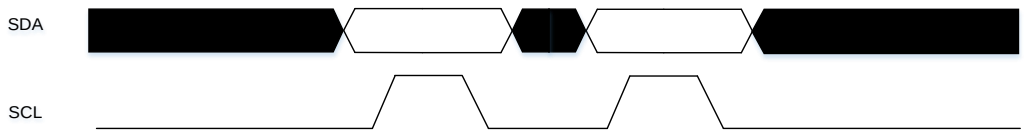
Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via current-source or pull-up resistor. When the bus is free, both lines are HIGH. The output stages of

devices connected to the bus must have an open-drain or open-collect to perform the wired-AND function. Data on the I2C-bus can be transferred at rates of up to 100 Kbit/s in the standard-mode, up to 400 Kbit/s in the fast-mode and up to 1Mbit/s in the fast-mode-plus if the FMPEN bit in I2C_FMPCFG is set. Due to the variety of different technology devices (CMOS, NMOS, bipolar) that can be connected to the I2C-bus, the voltage levels of the logical '0' (LOW) and '1' (HIGH) are not fixed and depend on the associated level of V_{DD}.

17.3.2. Data validation

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the SDA line can only change when the clock signal on the SCL line is LOW (see ***Figure 17-2. Data validation***). One clock pulse is generated for each data bit transferred.

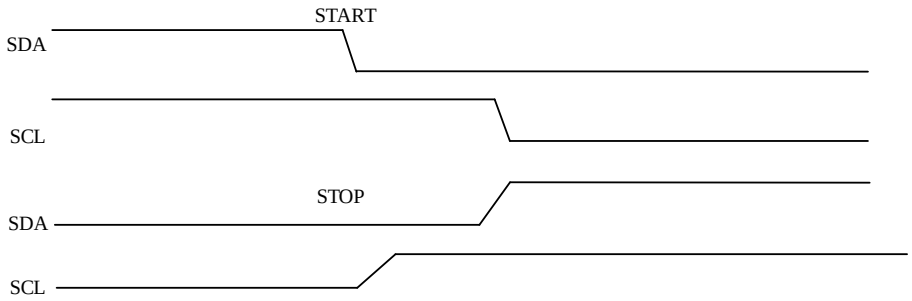
Figure 17-2. Data validation



17.3.3. START and STOP signal

All transmissions begin with a START and are terminated by a STOP (see ***Figure 17-3. START and STOP condition***). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START signal. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP signal.

Figure 17-3. START and STOP condition



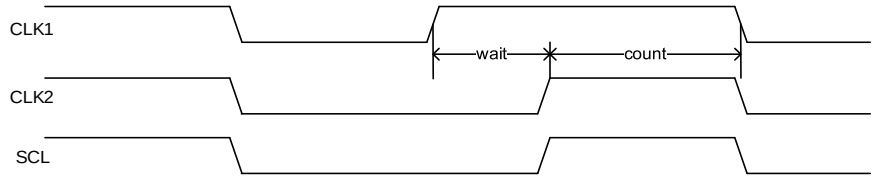
17.3.4. Clock synchronization

Two masters can begin transmitting on a free bus at the same time and there must be a method for deciding which master takes control of the bus and completes its transmission. This is done by clock synchronization and bus arbitration. In a single master system, clock

synchronization and bus arbitration are unnecessary.

Clock synchronization is performed using the wired-AND connection of I2C interfaces to the SCL line. This means that a HIGH to LOW transition on the SCL line causes the masters concerned to start counting their LOW period and, once a master clock has gone LOW, it holds the SCL line in that state until the clock HIGH state is reached (see ***Figure 17-4. Clock synchronization***). However, if another clock is still within its LOW period, the LOW to HIGH transition of this clock may not change the state of the SCL line. The SCL line is therefore held LOW by the master with the longest LOW period. Masters with shorter LOW period enter a HIGH wait-state during this time.

Figure 17-4. Clock synchronization



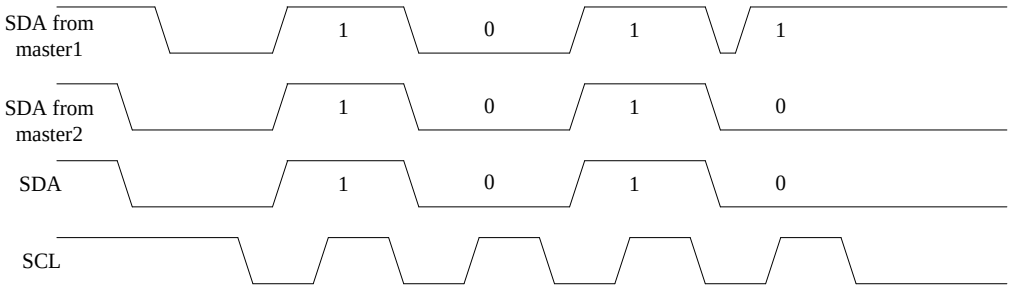
17.3.5. Arbitration

Arbitration, like synchronization, is part of the protocol where more than one master is used in the system. Slaves are not involved in the arbitration procedure.

A master may start a transfer only if the bus is free. Two masters may generate a START signal within the minimum hold time of the START signal which results in a valid START signal on the bus. Arbitration is then required to determine which master will complete its transmission.

Arbitration proceeds bit by bit. During every bit, while SCL is HIGH, each master checks whether the SDA level matches what it has been sent. This process may take many bits. Two masters can even complete an entire transmission without error, as long as the transmissions are identical. The first time a master tries to send a HIGH, but detects that the SDA level is LOW, then the master knows that it has lost the arbitration and turns off its SDA output driver. The other master goes on to complete its transmission.

Figure 17-5. SDA line arbitration



17.3.6. I2C communication flow

Each I2C device is recognized by a unique address (whether it is a microcontroller, LCD driver, memory or keyboard interface) and can be operated as either a transmitter or receiver, depending on the function of the device.

An I2C slave will continue to detect addresses after a START signal on I2C bus and compare the detected address with its slave address which is programmed by software. Once the two addresses match with each other, the I2C slave will send an ACK to the I2C bus and respond to the following command on I2C bus: transmitting or receiving the desired data. Additionally, if General Call is enabled by software, the I2C slave always responds to a General Call Address (0x00). The I2C block supports both 7-bit and 10-bit address modes.

An I2C master always initiates or ends a transfer using START or STOP signal and it's also responsible for SCL clock generation.

Figure 17-6. I2C communication flow with 7-bit address

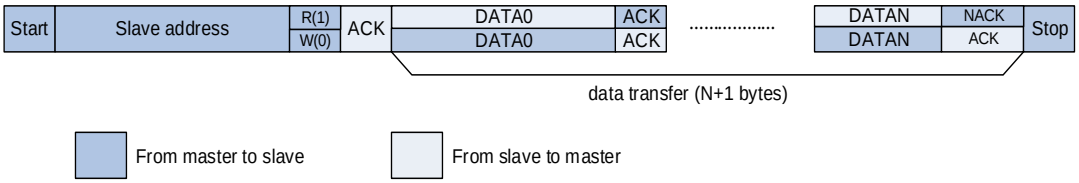


Figure 17-7. I2C communication flow with 10-bit address (Master Transmit)

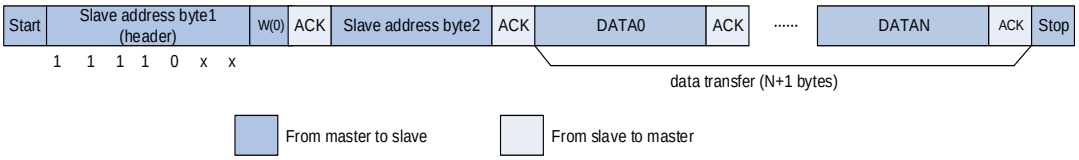

Figure 17-8. I2C communication flow with 10-bit address (Master Receive)

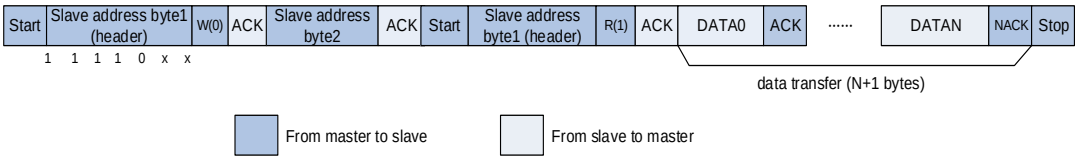


17.3.7. Programming model

An I2C device such as LCD driver may only be a receiver, whereas a memory can both receive and transmit data. In addition to transmitters and receivers, devices can also be considered as masters or slaves when performing data transfers. A master is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered as a slave.

An I2C device is able to transmit or receive data whether it's a master or a slave, thus, there're 4 operation modes for an I2C device:

- Master Transmitter.
- Master Receiver.
- Slave Transmitter.
- Slave Receiver.

I2C block supports all of the four I2C modes. After system reset, it works in slave mode. After sending a START signal on I2C bus, it changes into master mode. The I2C changes back to slave mode after sending a STOP signal on I2C bus.

Programming model in slave transmitting mode

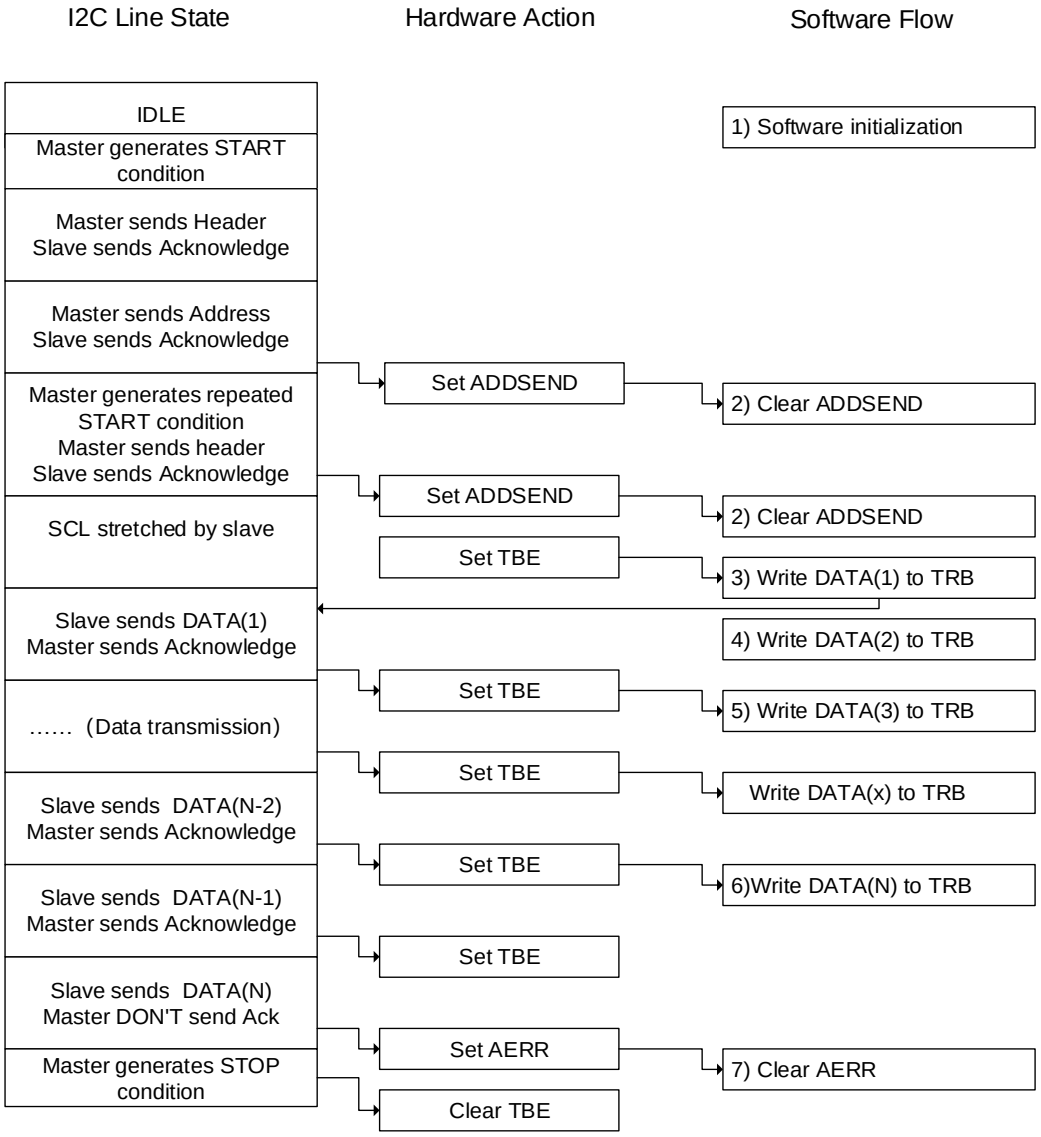
As is shown in ***Figure 17-9. Programming model for slave transmitting mode (10-bit address mode)***, the following software procedure should be followed if users wish to transmit data in slave transmitter mode:

1. First of all, enable I2C peripheral clock as well as configure clock related registers in I2C_CTL1 to make sure correct I2C timing. After enabled and configured, I2C operates in its default slave state and waits for START signal followed by address on I2C bus.
2. After receiving a START signal followed by a matched address, either in 7-bit format or in 10-bit format, the I2C hardware sets the ADDSEND bit in I2C_STAT0 register, which should be monitored by software either by polling or interrupt. After that, software should read I2C_STAT0 and then I2C_STAT1 to clear ADDSEND bit. If 10-bit addressing format is selected, the I2C master should then send a repeated START signal followed by a header to the I2C bus. The slave sets ADDSEND bit again after it detects the repeated START signal and the following header. The ADDSEND bit must be cleared by software again by reading I2C_STAT0 and then I2C_STAT1.
3. Now I2C enters data transmission stage and hardware sets TBE bit because both the shift register and data register I2C_DATA are empty. Once TBE is set, software should write the first byte of data to I2C_DATA register, TBE is not cleared in this case because the byte written in I2C_DATA is moved to the internal shift register immediately. I2C begins to transmit data to I2C bus as soon as the shift register is not empty.
4. During the transmission of the first byte, software can write the second byte to I2C_DATA, and this time TBE is cleared because neither I2C_DATA nor shift register is empty.
5. After the transmission of the first byte, the TBE bit will be set, the software can write the third byte to the I2C_DATA register and TBE is cleared. After this, any time TBE is set, software can write a byte to I2C_DATA as long as there is still data to be transmitted.
6. During the transmission of the second last byte, software writes the last data to I2C_DATA to clear the TBE flag and doesn't care TBE anymore. So TBE will be set after the byte's transmission and not cleared until a STOP signal.

   I2C master doesn't acknowledge to the last byte according to the I2C protocol, so after sending the last byte, I2C slave will wait for the STOP signal on I2C bus and sets AERR (Acknowledge Error) bit to notify software that the transmission completes. Software

clears AERR bit by writing 0 to it.

Figure 17-9. Programming model for slave transmitting mode (10-bit address mode)



Programming model in slave receiving mode

As is shown in ***Figure 17-10. Programming model for slave receiving (10-bit address mode)***, the following software procedure should be followed if users wish to receive data in slave receiver mode:

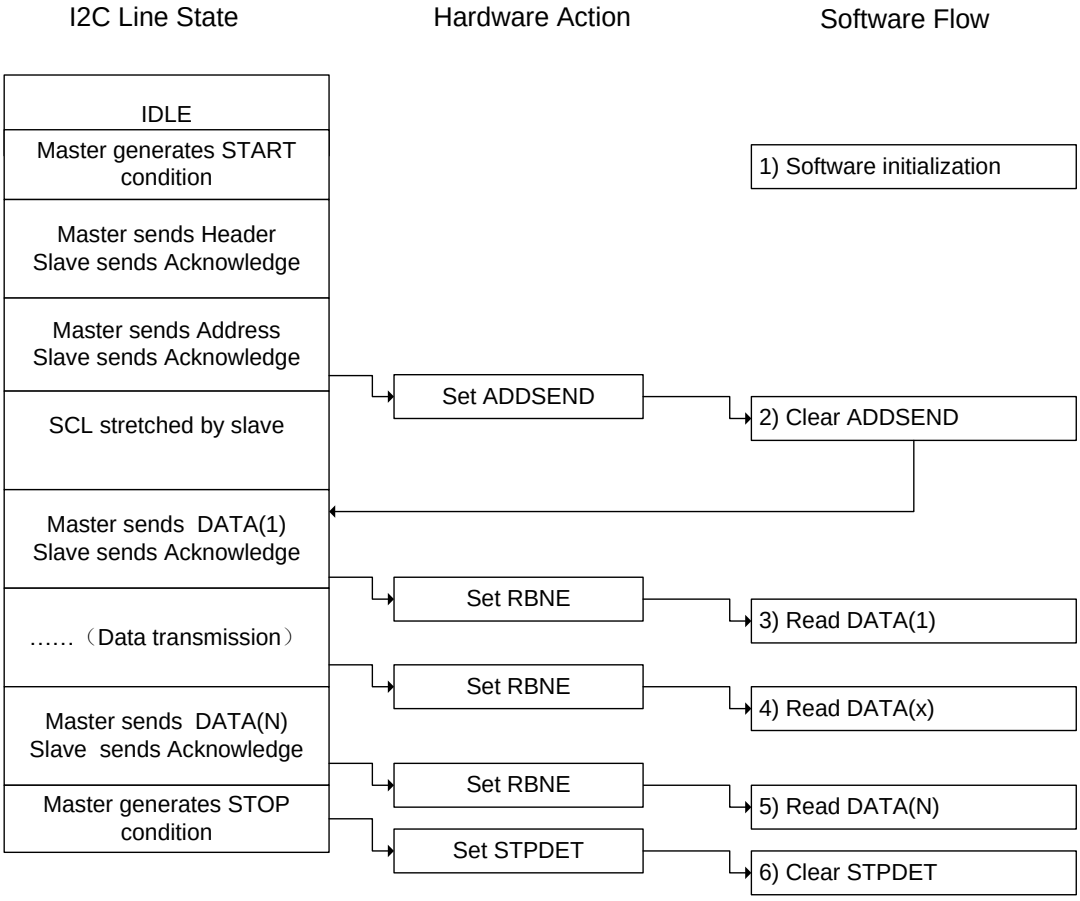
1. First of all, enable I2C peripheral clock as well as configure clock related registers in I2C_CTL1 to make sure correct I2C timing. After enabled and configured, I2C operates in its default slave state and waits for START signal followed by address on I2C bus.

2. After receiving a START signal followed by a matched 7-bit or 10-bit address, the I2C hardware sets the ADDSEND bit in I2C status register 0, which should be monitored by software either by polling or interrupt. After that software should read I2C_STAT0 and then I2C_STAT1 to clear ADDSEND bit. The I2C begins to receive data on I2C bus as

soon as ADDSEND bit is cleared.

3. As soon as the first byte is received, RBNE is set by hardware. Software can now read the first byte from I2C_DATA and RBNE is cleared as well.
4. Any time RBNE is set, software can read a byte from I2C_DATA.
5. After the last byte is received, RBNE is set. Software reads the last byte.
6. STPDET bit is set when I2C detects a STOP signal on I2C bus and software reads I2C_STAT0 and then writes I2C_CTL0 to clear the STPDET bit.

Figure 17-10. Programming model for slave receiving (10-bit address mode)



Programming model in master transmitting mode

As it shows in ***Figure 17-11. Programming model for master transmitting mode (10-bit address mode)***, the following software procedure should be followed if users wish to make transaction in master transmitter mode:

1. First of all, enable I2C peripheral clock as well as configure clock related registers in I2C_CTL1 to make sure correct I2C timing. After enabled and configured, I2C operates in its default slave state and waits for START signal followed by address on I2C bus.
2. Software sets START bit requesting I2C to generate a START signal on I2C bus.

3. After sending a START signal, the I2C hardware sets the SBSEND bit in I2C_STAT0 register and enters master mode. Now software should clear the SBSEND bit by reading I2C_STAT0 and then writing a 7-bit address or header of a 10-bit address to I2C_DATA. I2C begins to send address or header to I2C bus as soon as SBSEND bit is cleared. If the address which has been sent is header of a 10-bit address, the hardware sets ADD10SEND bit after sending the header and software should clear the ADD10SEND bit by reading I2C_STAT0 and writing 10-bit lower address to I2C_DATA.

4. After the 7-bit or 10-bit address has been sent, the I2C hardware sets the ADDSEND bit and software should clear the ADDSEND bit by reading I2C_STAT0 and then I2C_STAT1.

5. Now I2C enters data transmission stage and hardware sets TBE bit because both the shift register and data register I2C_DATA are empty. Software now writes the first byte data to I2C_DATA register, but the TBE will not be cleared because the byte written in I2C_DATA is moved to internal shift register immediately. The I2C begins to transmit data to I2C bus as soon as the shift register is not empty.

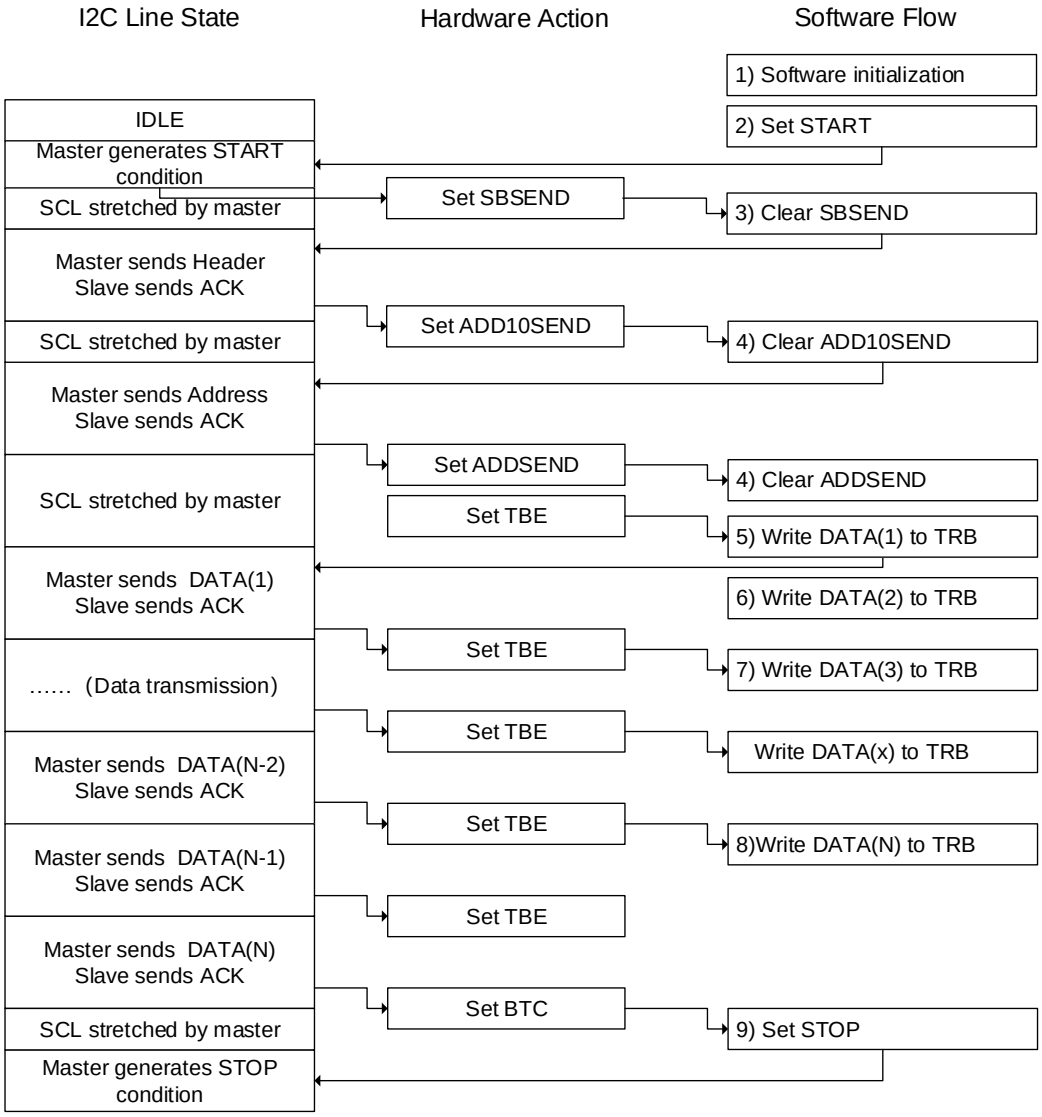
6. During the transmission of the first byte, software can write the second byte to I2C_DATA, and this time TBE is cleared because neither I2C_DATA nor shift register is empty.

7. Any time TBE is set, software can write a byte to I2C_DATA as long as there is still data to be transmitted.

8. During the transmission of the second last byte, software writes the last data to I2C_DATA to clear the TBE flag and doesn't care TBE anymore. So TBE will be asserted after the transmission of the byte and not be cleared until a STOP signal.

9. After sending the last byte, I2C master sets BTC bit because both the shift register and I2C_DATA are empty. Software should set the STOP bit to generate a STOP signal, then the I2C clears both TBE and BTC flags.

Figure 17-11. Programming model for master transmitting mode (10-bit address mode)



Programming model in master receiving mode

In master receiving mode, a master is responsible for generating NACK for the last byte reception and then sending STOP a condition on I2C bus. So, special attention should be paid to ensure the correct ending of data reception. Two solutions for master receiving are provided here for applications: Solution A and B. Solution A requires the software's quick response to I2C events, while Solution B doesn't.

Solution A

1. First of all, enable I2C peripheral clock as well as configure clock related registers in I2C_CTL1 to make sure correct I2C timing. After enabled and configured, I2C operates in its default slave state and waits for START signal followed by address on I2C bus.
2. Software sets START bit requesting I2C to generate a START signal on I2C bus.
3. After sending a START signal, the I2C hardware sets the SBSEND bit in I2C_STAT0

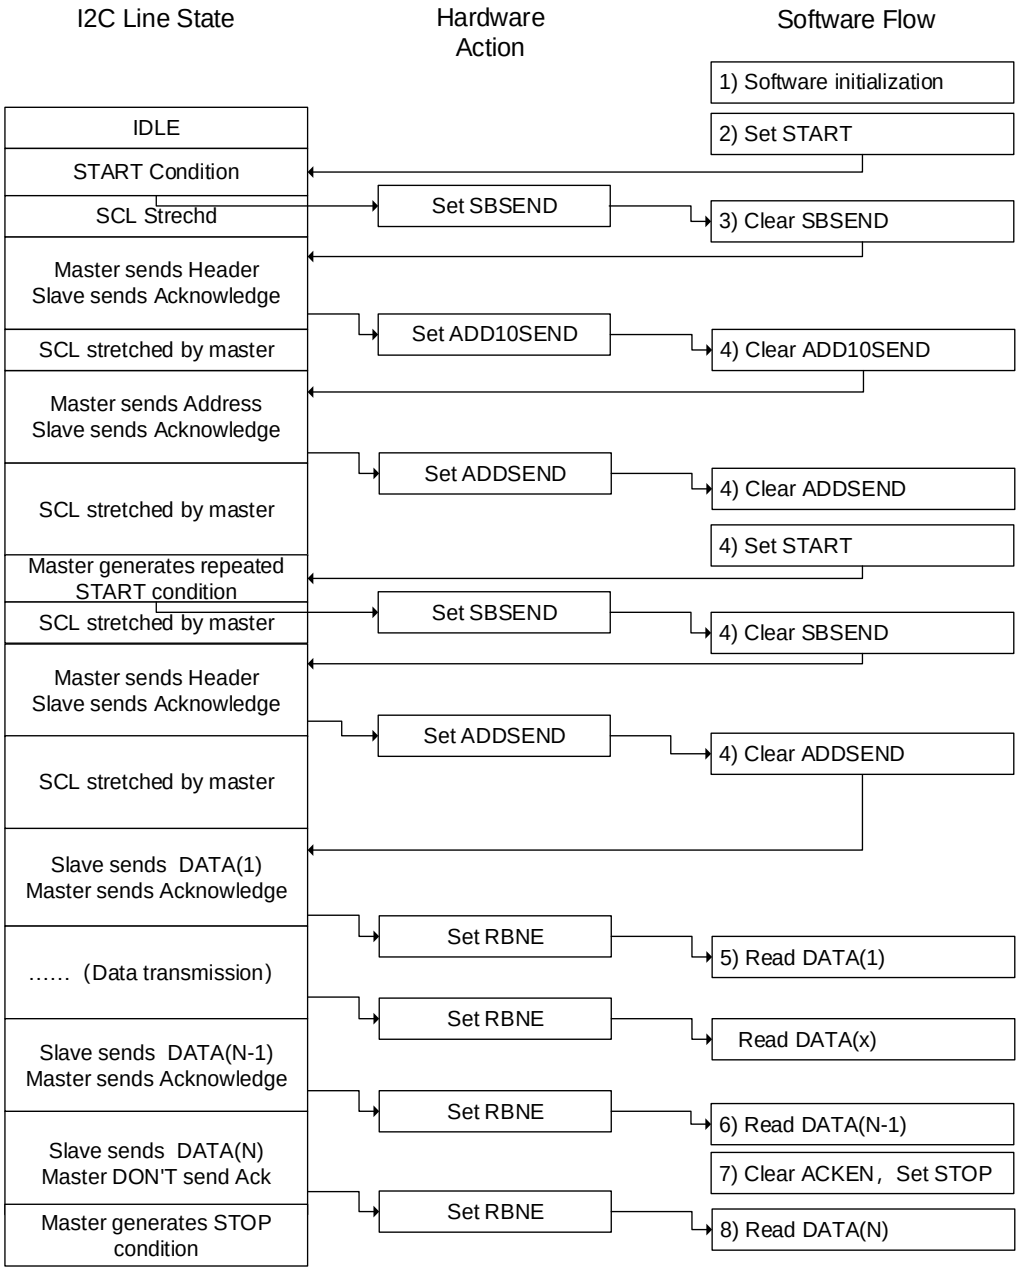
register and enters master mode. Now software should clear the SBSEND bit by reading I2C_STAT0 and then writing a 7-bit address or header of a 10-bit address to I2C_DATA. I2C begins to send address or header to I2C bus as soon as SBSEND bit is cleared. If the address which has been sent is header of a 10-bit address, the hardware sets ADD10SEND bit after sending header and software should clear the ADD10SEND bit by reading I2C_STAT0 and writing 10-bit lower address to I2C_DATA.

4. After the 7-bit or 10-bit address has been sent, the I2C hardware sets the ADDSEND bit and software should clear the ADDSEND bit by reading I2C_STAT0 and then I2C_STAT1. If the address is in 10-bit format, software should then set START bit again to generate a repeated START signal on I2C bus and SBSEND is set after the repeated START is sent out. Software should clear the SBSEND bit by reading I2C_STAT0 and writing header to I2C_DATA. Then the header is sent out to I2C bus, and ADDSEND is set again. Software should again clear ADDSEND by reading I2C_STAT0 and then I2C_STAT1.
5. As soon as the first byte is received, RBNE is set by hardware. Software now can read the first byte from I2C_DATA and RBNE is cleared as well.
6. Any time RBNE is set, software can read a byte from I2C_DATA.
7. After the second last byte (N-1)is received, the software should clear ACKEN bit and set STOP bit. These actions should complete before the end of the last byte's receiving to ensure that NACK will be sent for the last byte.
8. After the last byte is received, RBNE is set. Software reads the last byte. Since ACKEN has been cleared in the previous step, I2C doesn't send ACK for the last byte and it generates a STOP signal after the transmission of the last byte.

The above steps require byte number N>1. If N=1, Step 7 should be performed after Step 4 and completed before the end of the single byte's receiving.

Figure 17-12. Programming model for master receiving using Solution A (10-bit

address mode)



Solution B

1. First of all, enable I2C peripheral clock as well as configure clock related registers in I2C_CTL1 to make sure correct I2C timing. After enabled and configured, I2C operates in its default slave state and waits for START signal followed by address on I2C bus.
2. Software sets START bit requesting I2C to generate a START signal on I2C bus.
3. After sending a START signal, the I2C hardware sets the SBSEND bit in I2C_STAT0 register and enters master mode. Now software should clear the SBSEND bit by reading I2C_STAT0 and then writing a 7-bit address or header of a 10-bit address to I2C_DATA. I2C begins to send address or header to I2C bus as soon as SBSEND bit is cleared. If

the address which has been sent is a header of 10-bit address, the hardware sets ADD10SEND bit after sending header and software should clear the ADD10SEND bit by reading I2C_STAT0 and writing 10-bit lower address to I2C_DATA.

4. After the 7-bit or 10-bit address has been sent, the I2C hardware sets the ADDSEND bit and software should clear the ADDSEND bit by reading I2C_STAT0 and then I2C_STAT1. If the address is in 10-bit format, software should then set START bit again to generate a repeated START signal on I2C bus and SBSEND is set after the repeated START is sent out. Software should clear the SBSEND bit by reading I2C_STAT0 and writing header to I2C_DATA. Then the header is sent out to I2C bus, and ADDSEND is set again. Software should again clear ADDSEND by reading I2C_STAT0 and then I2C_STAT1.
5. As soon as the first byte is received, RBNE is set by hardware. Software now can read the first byte from I2C_DATA and RBNE is cleared as well.
6. Any time RBNE is set, software can read a byte from I2C_DATA until the master receives N-3 bytes.

As shown in ***Figure 17-13. Programming model for master receiving mode using solution B (10-bit address mode)***, the N-2 byte is not read out by software, so after the N-1 byte is received, both BTC and RBNE are asserted. The bus is stretched by master to prevent the reception of the last byte. Then software should clear ACKEN bit.

7. Software reads out N-2 byte, clearing BTC. After this, the N-1 byte is moved from shift register to I2C_DATA and bus is released and begins to receive the last byte. Master doesn't send an ACK for the last byte because ACKEN is already cleared.
8. After the last byte is received, both BTC and RBNE are set again, and SCL is stretched low. Software sets STOP bit and master sends out a STOP signal on bus.
9. Software reads the N-1 byte, clearing BTC. After this the last byte is moved from shift register to I2C_DATA.
10. Software reads the last byte, clearing RBNE.

The above steps require that byte number N>2. N=1 and N=2 are similar:

N=1

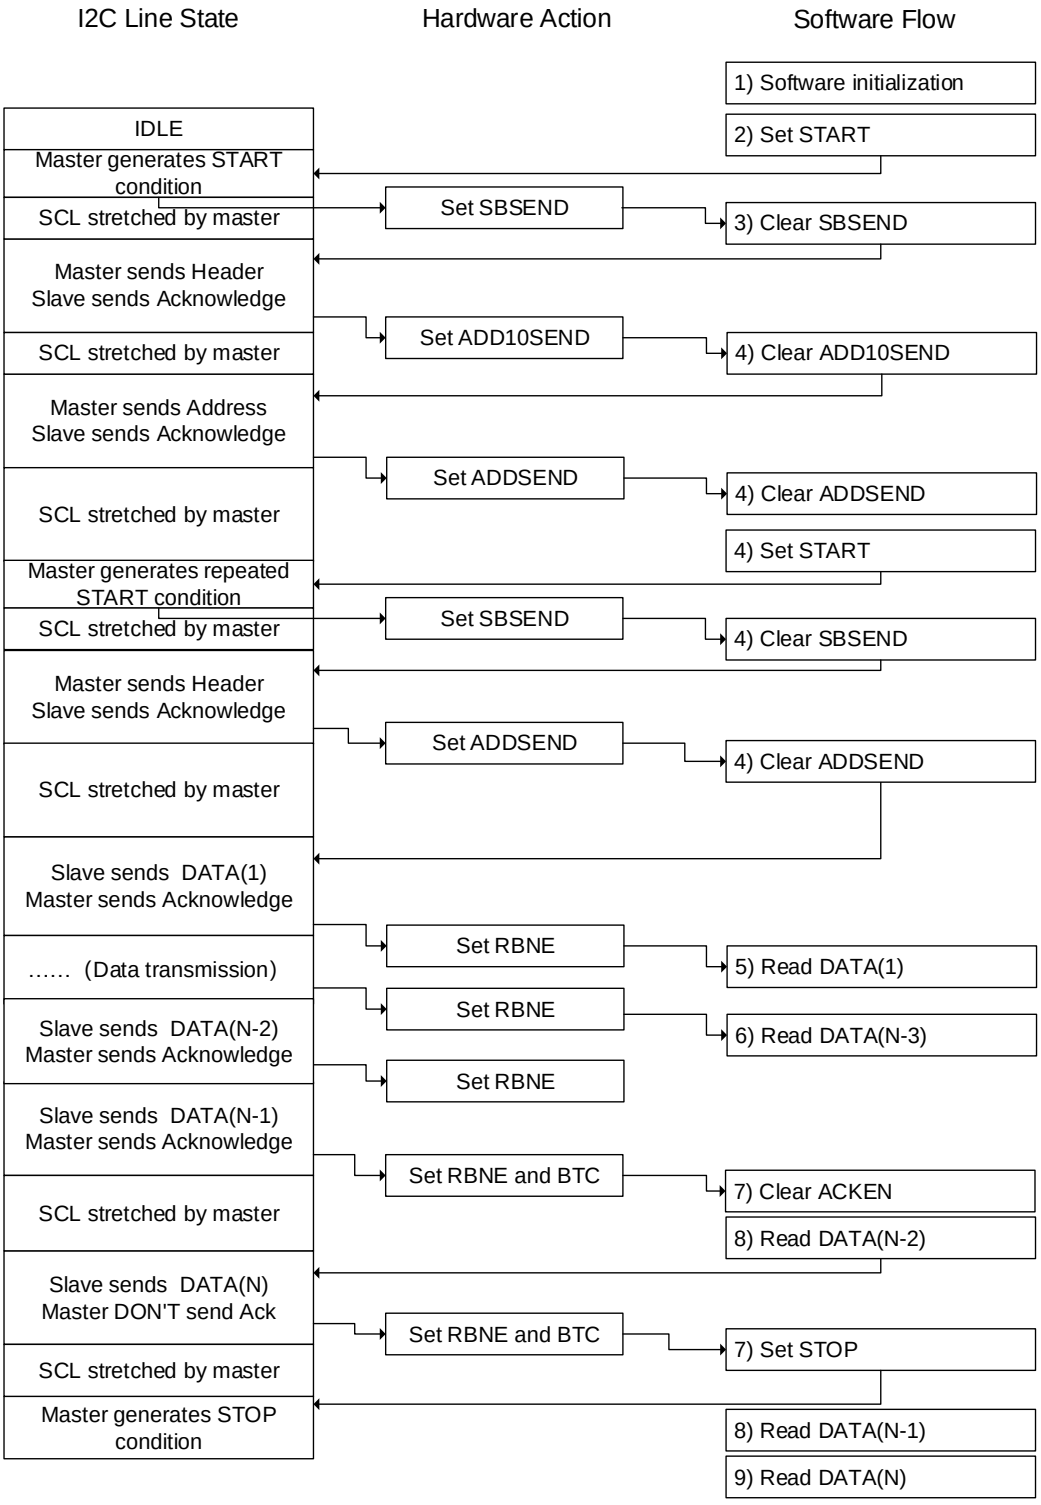
In Step4, software should reset ACKEN bit before clearing ADDSEND bit and set STOP bit after clearing ADDSEND bit. Step 5 is the last step when N=1.

N=2

In Step 2, software should set POAP bit before setting START bit. In Step 4, software should reset ACKEN bit before clearing ADDSEND bit. In Step 5, software should wait until BTC is set and then set STOP bit and read I2C_DATA twice.

Figure 17-13. Programming model for master receiving mode using solution B (10-bit

address mode)



17.3.8. SCL line stretching

The SCL line stretching function is designed to avoid overflow error in reception and underflow error in transmission. As is shown in Programming Model, when the TBE and BTC bits are set in transmitting mode, the transmitter stretches the SCL line low until the transfer buffer

register is filled with the next data to be transmitted. When the RBNE and BTC bits are set in receiving mode, the receiver stretches the SCL line low until the data in the transfer buffer is read out.

When works in slave mode, the SCL line stretching function can be disabled by setting the SS bit in the I2C_CTL0 register. If this bit is set, the software is required to be quick enough to serve the TBE, RBNE and BTC status, otherwise, overflow or underflow situation might occur.

17.3.9. Use DMA for data transfer

As is shown in Programming Model, each time TBE or RBNE is asserted, software should write or read a byte, this may cause CPU to be high overloaded. The DMA controller can be used to process TBE and RBNE flags: each time TBE or RBNE is asserted, DMA controller does a read or write operation automatically. It reduces the load on the CPU. See the DMA section for details on how to configure DMA.

The DMA request is enabled by the DMAON bit in the I2C_CTL1 register. This bit should be set after clearing the ADDSEND status. If the SCL line stretching function is disabled for a slave device, the DMAON bit should be set before the ADDSEND event.

Refer to the specification of the DMA controller for the configuration method of a DMA stream. The DMA controller must be configured and enabled before the I2C transfer. When the configured number of bytes have been transferred, the DMA controller generates End of Transfer (EOT) interrupt. DMA will send an End of Transmission (EOT) signal to the I2C interface and generates a DMA full transfer finish interrupt.

When a master receives two or more bytes, the DMALST bit in the I2C_CTL1 register should be set. The I2C master will send NACK after the last byte. The STOP bit can be set by software to generate a STOP signal in the ISR of the DMA full transfer finish interrupt.

When a master receives only one byte, the ACKEN bit must be cleared before clearing the ADDSEND status. Software can set the STOP bit to generate a STOP signal after clearing the ADDSEND status, or in the ISR of the DMA full transfer finish interrupt.

17.3.10. Packet error checking

There is a CRC-8 calculator in I2C block to perform PEC (Packet Error Checking) for I2C data. The polynomial of the CRC is x8 + x2 + x + 1 which is compatible with the SMBus protocol. If enabled by setting PECEN bit, the PEC will calculate all the data transmitted through I2C including address. I2C is able to send out the PEC value after the last data byte or check the received PEC value with its calculated PEC using the PECTRANS bit. In DMA mode, the I2C will send or check PEC value automatically if PECEN bit and PECTRANS bit are set.

17.3.11. SMBus support

The System Management Bus (abbreviated to SMBus or SMB) is a single-ended simple two-wire bus for the purpose of lightweight communication. Most commonly it is found in computer motherboards for communication with power source for ON/OFF instructions.It is derived from I2C for communication with low-bandwidth devices on a motherboard, especially power related chips such as a laptop's rechargeable battery subsystem (see Smart Battery Data).

SMBus protocol

Each message transmission on SMBus follows the format of one of the defined SMBus protocols. The SMBus protocols are a subset of the data transfer formats defined in the I2C specifications. I2C devices that can be accessed through one of the SMBus protocols are compatible with the SMBus specifications. I2C devices that do not adhere to these protocols cannot be accessed by standard methods as defined in the SMBus and Advanced Configuration and Power Management Interface (abbreviated to ACPI) specifications.

Address resolution protocol

The SMBus is realized based on I2C hardware and it uses I2C hardware addressing, but it adds the second-level software for building special systems. Additionally, its specifications include an Address Resolution Protocol that can make dynamic address allocations. Dynamic reconfiguration of the hardware and software allows bus devices to be ‘hot-plugged’ and used immediately, without restarting the system. The devices are recognized automatically and assigned unique addresses. This advantage results in a plug-and-play user interface. In this protocol there is a very useful distinction between a system host and all the other devices in the system, that is the host provides address assignment function.

Time-out feature

SMBus has a time-out feature which resets devices if a communication takes too long. This explains the minimum clock frequency is 10 kHz to prevent locking up the bus. I2C can be a ‘DC’ bus, which means that a slave device stretches the master clock when performing some routines while the master is accessing it. This will notify the master that the slave is busy but does not want to lose the communication. The slave device will continue the communication after its task is completed. There is no limit in the I2C bus protocol of how long this delay can be, whereas for a SMBus system, it would be limited to 25ms. SMBus protocol just assumes that if something takes too long, then it means that there is a problem on the bus and that all devices must reset in order to solve the problem. Slave devices are not allowed to hold the clock low too long.

Packet error checking

SMBus 2.0 and 1.1 allow Packet Error Checking (PEC). In that mode, a PEC byte is appended at the end of each transaction. The byte is a CRC-8 checksum of the entire message including

the address and read/write bit. The polynomial used is x8+x2+x+1 (the CRC-8-ATM HEC algorithm, initialized to zero).

SMBus alert

The SMBus has an extra optional shared interrupt signal called SMBALERT# which can be used by slaves to tell the host to ask its slaves about events of interest. SMBus also defines a less common "Host Notify Protocol", providing similar notifications which is based on the I2C multi-master mode but it can pass more data.

SMBus programming flow

The programming flow for SMBus is similar to normal I2C. In order to use SMBus mode, the application should configure several SMBus specific registers, respond to some SMBus specific flags and implement the upper protocols described in SMBus specification.

1. Before communication, SMBEN bit in I2C_CTL0 should be set and SMBSEL and ARPEN bits should be configured to desired values.
2. In order to support address resolution protocol (ARP) (ARPEN=1), the software should respond to HSTSMB flag in SMBus Host Mode (SMBSEL =1) or DEFSMB flag in SMBus Device Mode, and implement the function of ARP protocol.
3. In order to support SMBus Alert Mode, the software should respond to SMBALT flag and implement the related function.

17.3.12. Status, errors and interrupts

There are several status and error flags in I2C, and interrupts may be asserted from these flags by setting some register bits (refer to ***Register definition*** for detail).

Table17-2. Event status flags

Event Flag Name	Description
SBSEND	START signal sent (master)
ADDSEND	Address sent or received
ADD10SEND	Header of 10-bit address sent
STPDET	STOP signal detected
BTC	Byte transmission completed
TBE	I2C_DATA is empty when transmitting
RBNE	I2C_DATA is not empty when receiving

Table17-3. I2C error flags

Error Name	Description
BERR	Bus error
LOSTARB	Arbitration lost
OUERR	Over-run or under-run when SCL stretch is disabled.

Error Name	Description
AERR	No acknowledge received
PECERR	CRC value doesn't match
SMBTO	Bus timeout in SMBus mode
SMBALT	SMBus Alert

17.4. Register definition

I2C0 base address: 0x4000 5400

I2C1 base address: 0x4000 5800

17.4.1. Control register 0 (I2C_CTL0)

Address offset: 0x00
Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SRESET	Reserved	SALT	PECTRANS	POAP	ACKEN	STOP	START	SS	GCEN	PECEN	ARPEN	SMBSEL	Reserved	SMBEN	I2CEN
rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15	SRESET	Software resets I2C, software should wait until the I2C lines are released to reset the I2C 0: I2C is not reset 1: I2C is reset
14	Reserved	Must be kept at reset value.
13	SALT	SMBus Alert. Issue alert through SMBA pin. Software can set and clear this bit and hardware can clear this bit. 0: Don't issue alert through SMBA pin 1: Issue alert through SMBA pin
12	PECTRANS	PEC transfer Software sets and clears this bit while hardware clears this bit when PEC is transferred or START/STOP condition is detected I2CEN=0

		0: Don't transfer PEC value 1: Transfer PEC value
11	POAP	Position of ACK and PEC when receiving This bit is set and cleared by software and cleared by hardware when I2CEN=0 0: ACKEN bit specifies whether to send ACK or NACK for the current byte that is being received. PECTRANS bit indicates that the current receiving byte is a PEC byte 1: ACKEN bit specifies whether to send ACK or NACK for the next byte that is to be received, PECTRANS bit indicates the next byte that is to be received is a PEC byte
10	ACKEN	ACK enable This bit is set and cleared by software and cleared by hardware when I2CEN=0 0: ACK will not be sent 1: ACK will be sent
9	STOP	Generate a STOP condition on I2C bus This bit is set and cleared by software and set by hardware when SMBus timeout and cleared by hardware when STOP condition is detected. 0: STOP will not be sent 1: STOP will be sent
8	START	Generate a START condition on I2C bus This bit is set and cleared by software and cleared by hardware when a START condition is detected or I2CEN=0. 0: START will not be sent 1: START will be sent
7	DISSTRC	SCL stretching Whether to stretch SCL low when data is not ready in slave mode. This bit is set and cleared by software. 0: SCL stretching is enabled 1: SCL stretching is disabled
6	GCEN	Whether or not to response to a General Call (0x00) 0: Slave won't respond to a General Call 1: Slave will respond to a General Call
5	PECEN	PEC calculation enable 0: PEC calculation disable 1: PEC calculation enable
4	ARPEN	ARP protocol enable 0: ARP is disabled 1: ARP is enabled
3	SMBSEL	SMBus type selection

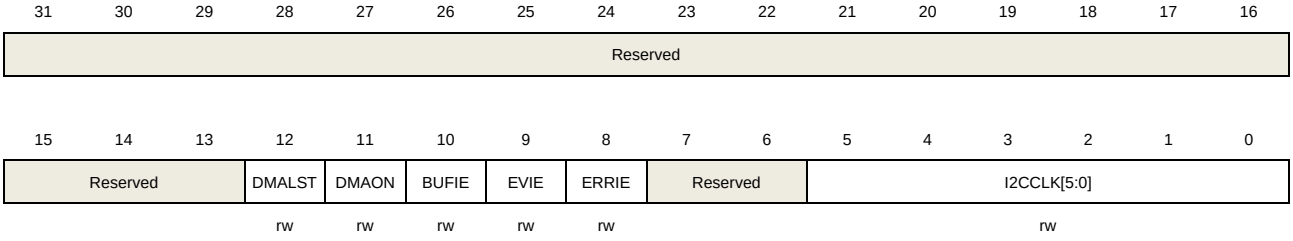
		0: Device 1: Host
2	Reserved	Must be kept at reset value.
1	SMBEN	SMBus/I2C mode switch 0: I2C mode 1: SMBus mode
0	I2CEN	I2C peripheral enable 0: I2C is disabled 1: I2C is enabled

17.4.2. Control register 1 (I2C_CTL1)

Address offset: 0x04

Reset value: 0x0000 0000

This register can be accessed by half-word(16-bit) or word (32-bit)



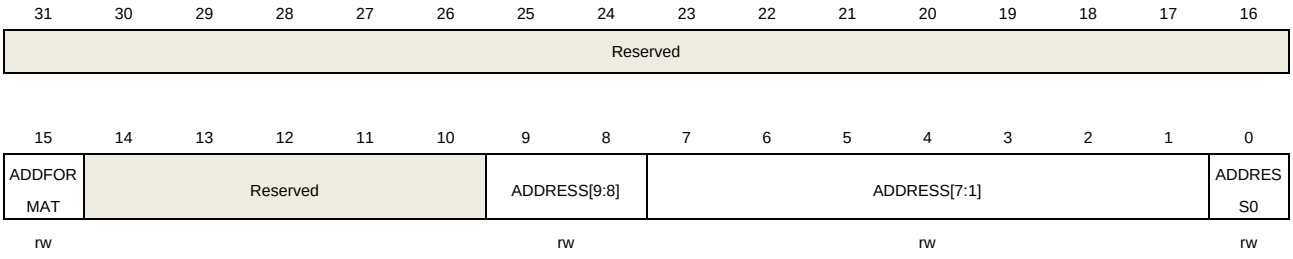
Bits	Fields	Descriptions
31:13	Reserved	Must be kept at reset value.
12	DMALST	DMA last transfer configure 0: Next DMA EOT is not the last transfer 1: Next DMA EOT is the last transfer
11	DMAON	DMA is mode switched on 0: DMA mode is switched off 1: DMA mode is switched on
10	BUFIE	0: Buffer interrupt is disabled 1: Buffer interrupt is enabled, which means that interrupt will be generated when TBE = 1 or RBNE = 1 if EVIE=1.
9	EVIE	Event interrupt enable 0: Event interrupt is disabled 1: Event interrupt is enabled, which means that interrupt will be generated when SBSEND, ADDSEND, ADD10SEND, STPDET or BTC flag asserted or TBE=1 or RBNE=1 if BUFIE=1.

8	ERRIE	Error interrupt enable 0: Error interrupt is disabled 1: Error interrupt is enabled, which means that interrupt will be generated when BERR, LOSTARB, AERR, OUERR, PECERR, SMBTO or SMBALT flag is asserted.
7	Reserved	Must be kept at reset value.
6:0	I2CCLK[6:0]	I2C peripheral clock frequency I2CCLK[6:0]should be the frequency of input APB1 clock in MHz which is at least 2. 0d – 1d: Not allowed 2d – 60d: 2 MHz~60MHz 61d – 127d: Not allowed due to the limitation of APB1 clock **Note**: In I2C standard mode, the frequencies of APB1 must be equal or greater than 2MHz. In I2C fast mode, the frequencies of APB1 must be equal or greater than 8MHz. In I2C fast mode plus, the frequencies of APB1 must be equal or greater than 24MHz.

17.4.3. Slave address register 0 (I2C_SADDR0)

Address offset: 0x08
Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15	ADDFORMAT	Address format for the I2C slave 0: 7-bit address 1: 10-bit address
14:10	Reserved	Must be kept at reset value.
9:8	ADDRESS[9:8]	Highest two bits of a 10-bit address
7:1	ADDRESS[7:1]	7-bit address or bits 7:1 of a 10-bit address

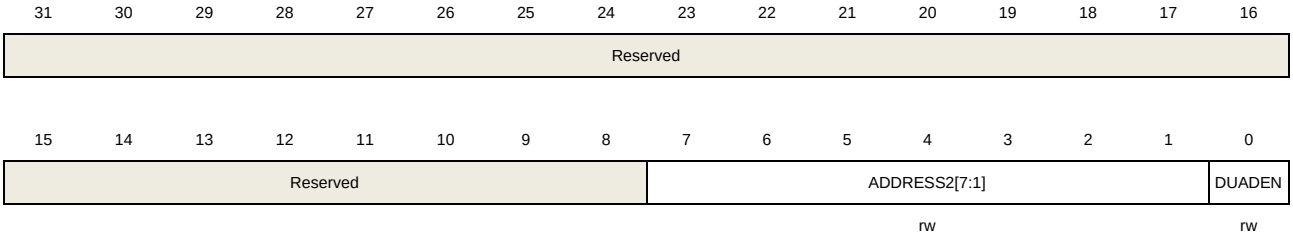
0	ADDRESS0	Bit 0 of a 10-bit address

17.4.4. Slave address register 1 (I2C_SADDR1)

Address offset: 0x0C

Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)



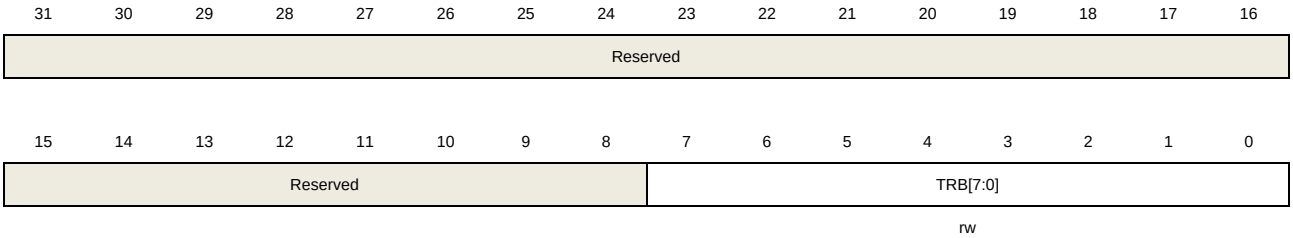
Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value.
7:1	ADDRESS2[7:1]	The second I2C address for the slave in Dual-Address mode
0	DUADEN	Dual-Address mode enable 0: Dual-Address mode is disabled 1: Dual-Address mode is enabled

17.4.5. Transfer buffer register (I2C_DATA)

Address offset: 0x10

Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)



Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value.
7:0	TRB[7:0]	Transmission or reception data buffer

17.4.6. Transfer status register 0 (I2C_STAT0)

Address offset: 0x14

Reset value: 0x0000 0000

This register can be accessed byhalf-word (16-bit) or word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SMBALT	SMBTO	Reserved	PECERR	OUERR	AERR	LOSTARB	BERR	TBE	RBNE	Reserved	STPDET	ADD10SEND	BTC	ADDSEND	SBSEND
rc_w0	rc_w0		rc_w0	rc_w0	rc_w0	rc_w0	rc_w0	r	r		r	r	r	r	r

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15	SMBALT	SMBus Alert status This bit is set by hardware and cleared by writing 0. 0: SMBA pin not pulled down (device mode) or no Alert detected (host mode) 1: SMBA pin pulled down and Alert address received (device mode) or Alert detected (host mode)
14	SMBTO	Timeout signal in SMBus mode This bit is set by hardware and cleared by writing 0. 0: No timeout error 1: Timeout event occurs (SCL is low for 25 ms)
13	Reserved	Must keep at reset value.
12	PECERR	PEC error when receiving data This bit is set by hardware and cleared by writing 0. 0: Received PEC matches calculated PEC 1: Received PEC doesn’t match the calculated PEC, I2C will send NACK careless of ACKEN bit.
11	OUERR	Over-run or under-run situation occurs in slave mode, when SCL stretching is disabled. In slave receiving mode, if the last byte in I2C_DATA is not read out while the following byte is already received, over-run occurs. In slave transmitting mode, if the current byte is already sent out, while the I2C_DATA is still empty, under-run occurs. This bit is set by hardware and cleared by writing 0. 0: No over-run or under-run occurs. 1: Over-run or under-run occurs.
10	AERR	Acknowledge error This bit is set by hardware and cleared by writing 0. 0: No acknowledge error

		1: Acknowledge error
9	LOSTARB	Arbitration lost in master mode This bit is set by hardware and cleared by writing 0. 0: No arbitration lost 1: Arbitration lost occurs and the I2C block changes back to slave mode.
8	BERR	Bus error A bus error occurs when an unexpected START or STOP signal on I2C bus. This bit is set by hardware and cleared by writing 0. 0: No bus error 1: A bus error detected
7	TBE	I2C_DATA is empty during transmitting This bit is set by hardware after it moves a byte from I2C_DATA to shift register and cleared by writing a byte to I2C_DATA. If both the shift register and I2C_DATA are empty, writing I2C_DATA won't clear TBE (refer to Programming Model for detail). 0: I2C_DATA is not empty 1: I2C_DATA is empty, software can write
6	RBNE	I2C_DATA is not empty during receiving This bit is set by hardware after it moves a byte from shift register to I2C_DATA and cleared by reading I2C_DATA. If both BTC and RBNE are asserted, reading I2C_DATA won't clear RBNE because the shift register's byte will be moved to I2C_DATA immediately. 0: I2C_DATA is empty 1: I2C_DATA is not empty, software can read
5	Reserved	Must be kept at reset value.
4	STPDET	STOP signal is detected in slave mode This bit is set by hardware and cleared by reading I2C_STAT0 and then writing I2C_CTL0. 0: STOP signal not detected in slave mode 1: STOP signal detected in slave mode
3	ADD10SEND	Header of 10-bit address is sent in master mode This bit is set by hardware and cleared by reading I2C_STAT0 and writing I2C_DATA. 0: No header of 10-bit address is sent in master mode 1: Header of 10-bit address is sent in master mode
2	BTC	Byte transmission is completed. If a byte is already received in shift register but I2C_DATA is still full in receiving mode or a byte is already sent out from shift register but I2C_DATA is still empty in transmitting mode, the BTC flag is asserted if SCL stretching enabled. This bit is set by hardware and cleared by 3 ways as follow:

		1. Software clearing: reading I2C_STAT0 followed by reading or writing I2C_DATA 2. Hardware clearing: sending the STOP signal or START signal 3. Bit 0 (I2CEN bit) of the I2C_CTL0 is reset. 0: BTC not asserted 1: BTC asserted
1	ADDSEND	Address is sent and ACK is received in master mode or address is received and matches with its own address in slave mode. This bit is set by hardware and cleared by reading I2C_STAT0 and reading I2C_STAT1. 0: In slave mode, no address is received or the received address does not match witih its own address. In master mode, no address is sent or address has been sent but not received the ACK from slave. 1: In slave mode, address is received and matches witih its own address. In master mode, address has been sent and receives the ACK from slave.
0	SBSEND	START signal is sent out in master mode This bit is set by hardware and cleared by reading I2C_STAT0 and writing I2C_DATA. 0: No START signal sent 1: START signal sent

17.4.7. Transfer status register 1 (I2C_STAT1)

Address offset: 0x18

Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PECV[7:0]								DUMODF	HSTSMB	DEFSMB	RXGC	Reserved	TR	I2CBSY	MASTER
r								r	r	r	r		r	r	r

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:8	PECV[7:0]	Packet Error Checking value that calculated by hardware when PEC is enabled.
7	DUMODF	Dual flag in slave mode indicates which address matches with the address in Dual-Address mode This bit is cleared by hardware after a STOP or a START condition or I2CEN=0 0: The address matches with SADDR0 address 1: The address matches with SADDR1 address

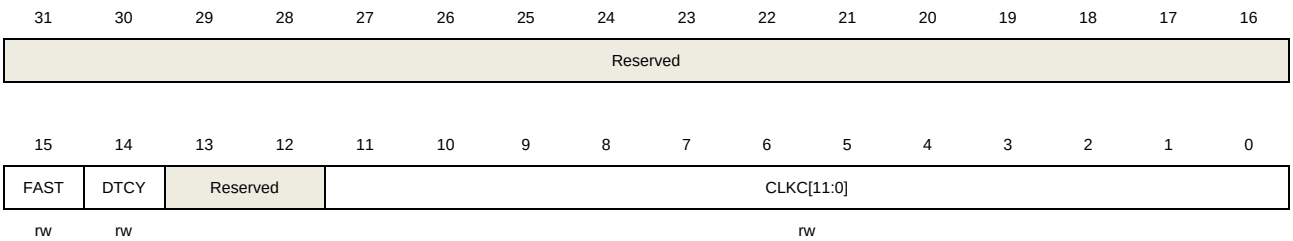
6	HSTSMB	SMBus host Header detected in slave mode This bit is cleared by hardware after a STOP or a START signal or I2CEN=0 0: No SMBus host Header is detected 1: SMBus host Header is detected
5	DEFSMB	Default address of SMBus device This bit is cleared by hardware after a STOP or a START signal or I2CEN=0. 0: The default address has not been received 1: The default address has been received for SMBus device
4	RXGC	General call address (0x00) received. This bit is cleared by hardware after a STOP or a START signal or I2CEN=0. 0: No general call address (0x00) received 1: General call address (0x00) received
3	Reserved	Must be kept at reset value.
2	TR	Transmitter or receiver This bit indicates whether the I2C is a transmitter or a receiver. It is cleared by hardware after a STOP or a START signal or I2CEN=0 or LOSTARB=1. 0: Receiver 1: Transmitter
1	I2CBSY	Busy flag This bit is cleared by hardware after a STOP signal 0: No I2C communication. 1: I2C communication active.
0	MASTER	A flag indicating whether I2C block is in master or slave mode. This bit is set by hardware when a START signal generates. This bit is cleared by hardware after a STOP signal or I2CEN=0 or LOSTARB=1. 0: Slave mode 1: Master mode

17.4.8. Clock configure register (I2C_CKCFG)

Address offset: 0x1C

Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)



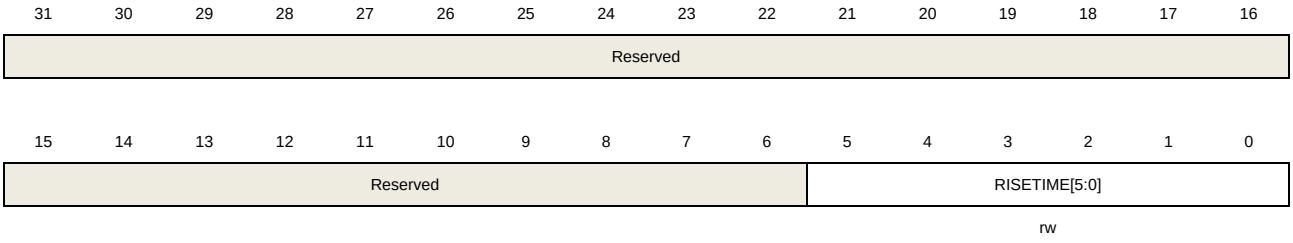
Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15	FAST	I2C speed selection in master mode 0: Standard speed 1: Fast speed
14	DTCY	Duty cycle in fast mode 0: $T_{low}/T_{high}=2$ 1: $T_{low}/T_{high}=16/9$
13:12	Reserved	Must be kept the reset value
11:0	CLKC[11:0]	I2C clock control in master mode In standard speed mode: $T_{high}=T_{low}=CLKC*T_{PCLK1}$ In fast speed mode or fast mode plus, if DTCY=0: $T_{high}=CLKC*T_{PCLK1}$ ， $T_{low}=2*CLKC*T_{PCLK1}$ In fast speed mode or fast mode plus, if DTCY=1: $T_{high}=9*CLKC*T_{PCLK1}$ ， $T_{low}=16*CLKC*T_{PCLK1}$ **Note**: If DTCY is 0, when PCLK1 is an integral multiple of 3, the baud rate will be more accurate. If DTCY is 1, when PCLK1 is an integral multiple of 25, the baud rate will be more accurate.

17.4.9. Rise time register (I2C_RT)

Address offset: 0x20

Reset value: 0x0000 0002

This register can be accessed by half-word (16-bit) or word (32-bit)



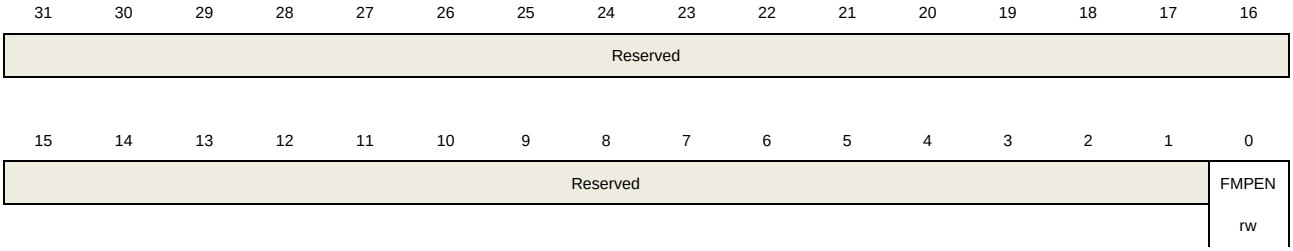
Bits	Fields	Descriptions
31:7	Reserved	Must be kept at reset value.
6:0	RISETIME[6:0]	Maximum rise time in master mode The RISETIME value should be the maximum SCL rise time incremented by 1.

17.4.10. Fast-mode-plus configure register (I2C_FMPCFG)

Address offset: 0x90

Reset value: 0x0000 0000

This register can be accessed by half-word (16-bit) or word (32-bit)



Bits	Fields	Descriptions
31:1	Reserved	Must be kept at reset value.
0	FMPEN	Fast mode plus enable The I2C device supports up to 1MHz when this bit is set. 0: Fast mode plus disabled 1: Fast mode plus enabled

18. Serial peripheral interface/Inter-IC sound (SPI/I2S)

18.1. Overview

The SPI/I2S module can communicate with external devices using the SPI protocol or the I2S audio protocol.

The serial peripheral interface (SPI) provides a SPI protocol of data transmission and reception function in master or slave mode. Both full-duplex and simplex communication modes are supported, with hardware CRC calculation and checking.

The inter-IC sound (I2S) supports four audio standards: I2S Philips standard, MSB justified standard, LSB justified standard, and PCM standard. I2S works at either master or slave mode for transmission and reception.

18.2. Characteristics

18.2.1. SPI characteristics

- Master or slave operation with full-duplex or half-duplex or simplex mode.
- Separate transmit and receive buffer, 16 bits wide.

- Data frame size can be 8 or 16 bits.
- Bit order can be LSB or MSB.
- Software and hardware NSS management.
- Hardware CRC calculation, transmission and checking.
- Transmission and reception using DMA.
- SPI TI mode supported.
- SPI NSS pulse mode supported.

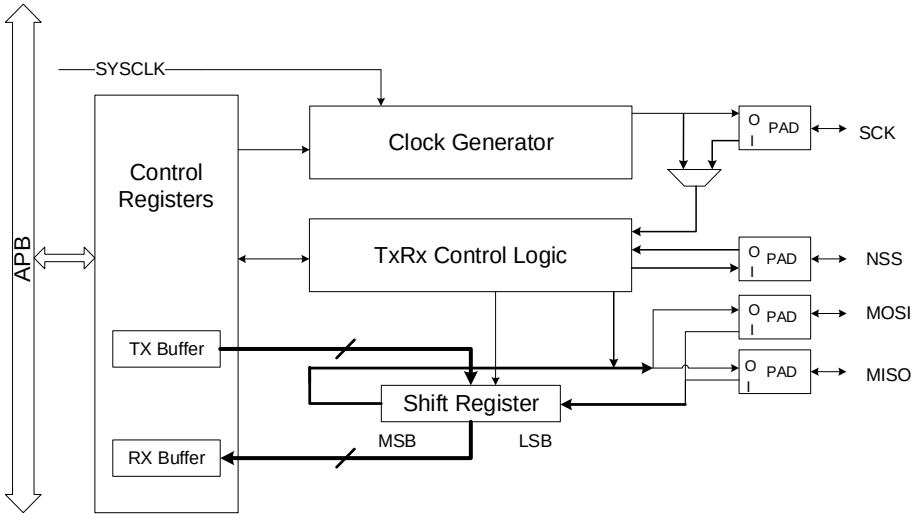
18.2.2. I2S characteristics

- Master or slave operation for transmission/reception.
- Four I2S standards supported: Philips, MSB justified, LSB justified and PCM standard.
- Data length can be 16 bits, 24 bits or 32 bits.
- Channel length can be 16 bits or 32 bits.
- Transmission and reception using a 16 bits wide buffer.
- Audio sample frequency can be 8 kHz to 192 kHz using I2S clock divider.
- Programmable idle state clock polarity.
- Master clock (MCK) can be output.
- Transmission and reception using DMA.

18.3. SPI function overview

18.3.1. SPI block diagram

Figure 18-1. Block diagram of SPI



18.3.2. SPI signal description

Normal configuration

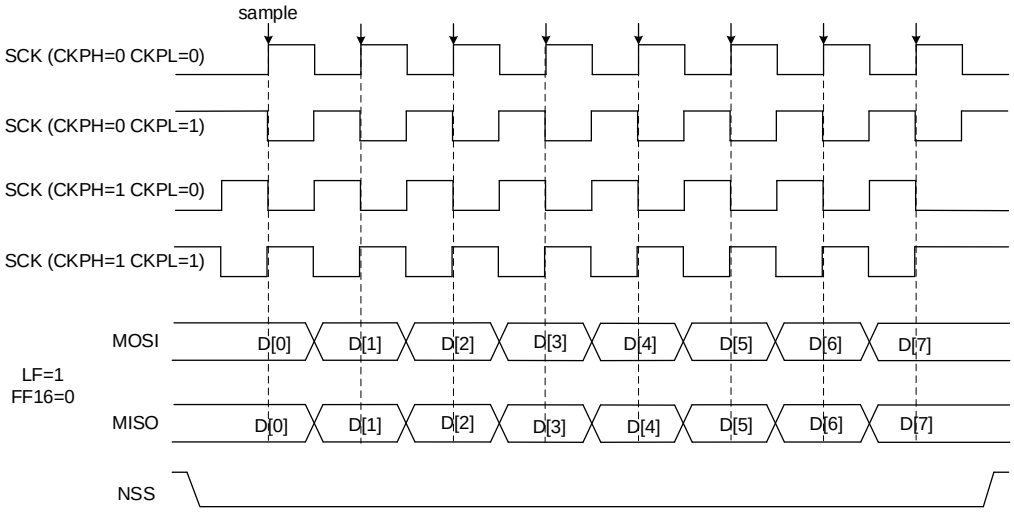
Table 18-1. SPI signal description

Pin name	Direction	Description
SCK	I/O	Master: SPI clock output Slave: SPI clock input
MISO	I/O	Master: data reception line Slave: data transmission line Master with bidirectional mode: not used Slave with bidirectional mode: data transmission and reception line.
MOSI	I/O	Master: data transmission line Slave: data reception line Master with bidirectional mode: data transmission and reception line. Slave with bidirectional mode: not used
NSS	I/O	Software NSS mode: not used Master in hardware NSS mode: when NSSDRV=1, it is NSS output, suitable for single master application; when NSSDRV=0, it is NSS input, suitable for multi-master application. Slave in hardware NSS mode: NSS input, as a chip select signal for slave.

18.3.3. SPI clock timing and data format

CKPL and CKPH bits in SPI_CTL0 register decide the timing of SPI clock and data signal. The CKPL bit decides the SCK level when idle and CKPH bit decides either first or second clock edge is a valid sampling edge. These bits take no effect in TI mode.

Figure 18-2. SPI timing diagram in normal mode



In normal mode, the length of data is configured by the FF16 bit in the SPI_CTL0 register. Data length is 16 bits if FF16=1, otherwise is 8 bits.

Data order is configured by the LF bit in SPI_CTL0 register, and SPI will first send the LSB if LF=1, or the MSB if LF=0. The data order is fixed to MSB first in TI mode.

18.3.4. NSS function

Slave mode

When slave mode is configured (MSTMOD=0), SPI gets NSS level from NSS pin in hardware NSS mode (SWNSSEN = 0) or from SWNSS bit in software NSS mode (SWNSSEN = 1) and transmits/receives data only when NSS level is low. In software NSS mode, NSS pin is not used.

Table 18-2. NSS function in slave mode

Mode	Register configuration	Description
Slave hardware NSS mode	MSTMOD = 0 SWNSSEN = 0	SPI slave gets NSS level from NSS pin.
Slave software NSS mode	MSTMOD = 0 SWNSSEN = 1	SPI slave NSS level is determined by the SWNSS bit. SWNSS = 0: NSS level is low SWNSS = 1: NSS level is high

Master mode

In master mode (MSTMOD=1) if the application uses multi-master connection, NSS can be configured to hardware input mode (SWNSSEN=0, NSSDRV=0) or software mode

(SWNSSEN=1). Then, once the NSS pin (in hardware NSS mode) or the SWNSS bit (in software NSS mode) goes low, the SPI automatically enters slave mode and triggers a master fault flag CONFERR.

If the application wants to use NSS line to control the SPI slave, NSS should be configured to hardware output mode (SWNSSEN=0, NSSDRV=1). NSS goes low after SPI is enabled.

The application may also use a general purpose IO as NSS pin to realize more flexible NSS.

Table 18-3. NSS function in master mode

Mode	Register configuration	Description
Master hardware NSS output mode	MSTMOD = 1 SWNSSEN = 0 NSSDRV=1	Applicable to single-master mode. The master uses the NSS pin to control the SPI slave device. At this time, the NSS is configured as the hardware output mode. NSS goes low after enabling SPI.
Master hardware NSS input mode	MSTMOD = 1 SWNSSEN = 0 NSSDRV=0	Applicable to multi-master mode. At this time, NSS is configured as hardware input mode. Once the NSS pin is pulled low, SPI will automatically enter slave mode, and a master configuration error will occur and the CONFERR bit will be set to 1.
Master software NSS mode	MSTMOD = 1 SWNSSEN = 1 SWNSS = 0 NSSDRV: Don't care	Applicable to multi-master mode. Once SWNSS = 0, SPI will automatically enter slave mode, and a master configuration error will occur and the CONFERR bit will be 1.
	MSTMOD = 1 SWNSSEN = 1 SWNSS = 1 NSSDRV: Don't care	The slave can use hardware or software NSS mode.

18.3.5. SPI operating modes

Table 18-4. SPI operating modes

Mode	Description	Register configuration	Data pin usage
MFD	Master full-duplex	MSTMOD = 1 RO = 0 BDEN = 0 BDOEN: Don't care	MOSI: transmission MISO: reception
MTU	Master transmission with unidirectional connection	MSTMOD = 1 RO = 0	MOSI: transmission MISO: not used

Mode	Description	Register configuration	Data pin usage
		BDEN = 0 BDOEN: Don't care	
MRU	Master reception with unidirectional connection	MSTMOD = 1 RO = 1 BDEN = 0 BDOEN: Don't care	MOSI: not used MISO: reception
MTB	Master transmission with bidirectional connection	MSTMOD = 1 RO = 0 BDEN = 1 BDOEN = 1	MOSI: transmission MISO: not used
MRB	Master reception with bidirectional connection	MSTMOD = 1 RO = 0 BDEN = 1 BDOEN = 0	MOSI: reception MISO: not used
SFD	Slave full-duplex	MSTMOD = 0 RO = 0 BDEN = 0 BDOEN: Don't care	MOSI: reception MISO: transmission
STU	Slave transmission with unidirectional connection	MSTMOD = 0 RO = 0 BDEN = 0 BDOEN: Don't care	MOSI: not used MISO: transmission
SRU	Slave reception with unidirectional connection	MSTMOD = 0 RO = 1 BDEN = 0 BDOEN: Don't care	MOSI: reception MISO: not used
STB	Slave transmission with bidirectional connection	MSTMOD = 0 RO = 0 BDEN = 1 BDOEN = 1	MOSI: not used MISO: transmission
SRB	Slave reception with bidirectional connection	MSTMOD = 0 RO = 0 BDEN = 1 BDOEN = 0	MOSI: not used MISO: reception

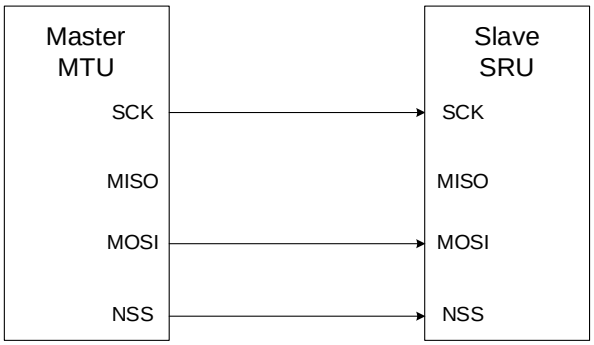

Figure 18-6. A typical bidirectional connection

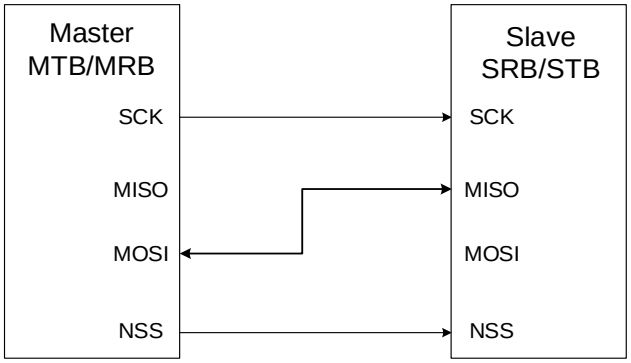

SPI initialization sequence

Before transmitting or receiving data, application should follow the SPI initialization sequence described below:

1. If master mode or slave TI mode is used, program the PSC [2:0] bits in SPI_CTL0 register to generate SCK with desired baud rate, or configure the Td time in TI mode, otherwise, ignore this step.
2. Program data format (FF16 bit in the SPI_CTL0 register).
3. Program the clock timing register (CKPL and CKPH bits in the SPI_CTL0 register).
4. Program the frame format (LF bit in the SPI_CTL0 register).
5. Program the NSS mode (SWNSSEN and NSSDRV bits in the SPI_CTL0 register) according to the application's demand as described above in ***NSS function*** section.
6. If TI mode is used, set TMOD bit in SPI_CTL1 register, otherwise, ignore this step.
7. Configure MSTMOD, RO, BDEN and BDOEN depending on the operating modes described in ***SPI operating modes*** section.
8. If Quad-SPI mode is used, set the QMOD bit in SPI_QCTL register. Ignore this step if Quad-SPI mode is not used.
9. Enable the SPI (set the SPIEN bit).

Note: During communication, CKPH, CKPL, MSTMOD, PSC[2:0] and LF bits should not be changed.

SPI basic transmission and reception sequence

Transmission sequence

After the initialization sequence, the SPI is enabled and stays at idle state. In master mode, the transmission starts when the application writes a data into the transmission buffer. In slave mode the transmission starts when SCK clock signal begins to toggle at SCK pin and NSS level is low, so application should ensure that data is already written into transmission buffer before the transmission starts in slave mode.

When SPI begins to send a data frame, it first loads this data frame from the transmission buffer to the shift register and then begins to transmit the loaded data frame. After TBE flag is set, which means the transmission buffer is empty, the application should write SPI_DATA register again if it has more data to transmit.

In master mode, software should write the next data into SPI_DATA register before the transmission of current data frame is completed if it desires to generate continuous transmission.

Reception sequence

After the last valid sample clock, the incoming data will be moved from shift register to the reception buffer and RBNE will be set. The application should read SPI_DATA register to get the received data and this will clear the RBNE flag automatically when reception buffer is

empty. In MRU and MRB modes, hardware continuously sends clock signal to receive the next data frame, while in full-duplex master mode (MFD), hardware only receives the next data frame when the transmission buffer is not empty.

SPI operation sequence in different modes (Not TI mode or NSSP mode)

In full-duplex mode, either MFD or SFD, the RBNE and TBE flags should be monitored and then follow the sequences described above.

The transmission mode (MTU, MTB, STU or STB) is similar to the transmission sequence of full-duplex mode except that the RBNE bit and RXORERR bit need to be ignored.

The master reception mode (MRU or MRB) is different from the reception sequence of full-duplex mode. In MRU or MRB mode, after SPI is enabled, the SPI continuously generates SCK until the SPI is disabled. So the application should ignore the TBE flag and read out reception buffer in time after the RBNE flag is set, otherwise a data overrun fault will occur.

The slave reception mode (SRU or SRB) is similar to the reception sequence of full-duplex mode except that the TBE bit need to be ignored.

SPI TI mode

SPI TI mode takes NSS as a special frame header flag signal and its operation sequence is similar to normal mode described above. The modes described above (MFD, MTU, MRU, MTB, MRB, SFD, STU, SRU, STB and SRB) are still supported in TI mode. While, in TI mode the CKPL and CKPH bits in SPI_CTL0 registers take no effect and the SCK sample edge is falling edge.

Figure 18-7. Timing diagram of TI master mode with discontinuous transfer

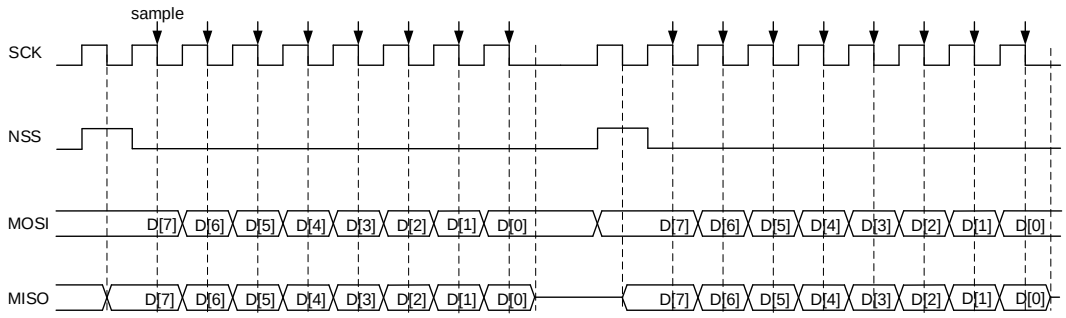

Figure 18-8. Timing diagram of TI master mode with continuous transfer

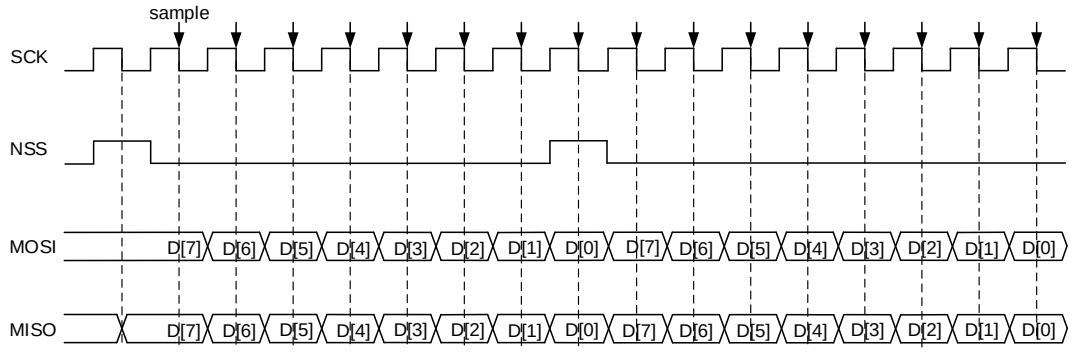
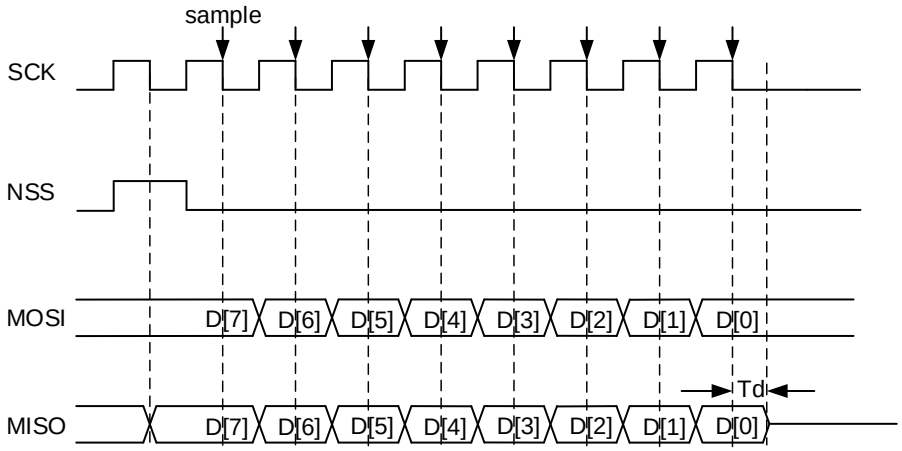


In master TI mode, SPI can perform continuous or non-continuous transfer. If the master writes SPI_DATA register fast enough, the transfer is continuous, otherwise non-continuous. In non-continuous transfer, there is an extra header clock cycle before each byte. While in continuous transfer, the extra header clock cycle only exists before the first byte and the following bytes' header clock is overlaid at the last bit of pervious bytes.

Figure 18-9. Timing diagram of TI slave mode



In slave TI mode, after the last rising edge of SCK in transfer, the slave begins to transmit the LSB bit of the last data byte, and after a half-bit time, the master begins to sample the line. To make sure that the master samples the right value, the slave should continue to drive this bit after the falling sample edge of SCK for a period of time before releasing the pin. This time is called T_d. T_d is decided by PSC[2:0] bits in SPI_CTL0 register.

$$T_d = \frac{T_{bit}}{2} + 5 * T_{pclk} \quad (18\text{-}1)$$

For example, if PSC[2:0] = 010, T_d is $9*T_{pclk}$.

In slave mode, the slave also monitors the NSS signal and sets an error flag FERR if it detects an incorrect NSS behavior, for example, toggles at the middle bit of a byte.

NSS pulse mode operation sequence

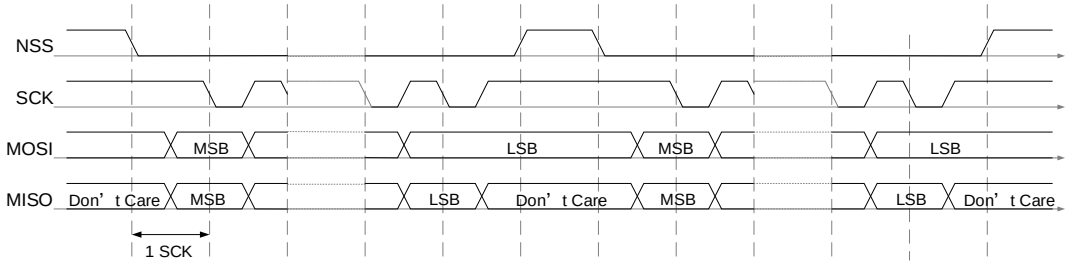
This function is controlled by NSSP bit in SPI_CTL1 register. In order to implement this

function, several additional conditions must be met: configure the device to master mode, frame format should follow the normal SPI protocol, select the first clock transition as the data capture edge.

In summary, MSTMOD = 1, NSSP = 1, CKPH = 0.

When NSS pulse mode is enabled, a pluse duration of at least 1 SCK clock period is inserted between two successive data frames depending on the status of internal data transmit buffer. Multiple SCK clock cycle intervals are possible if the transfer buffer stays empty. This function is designed for single master-slave configuration for the slave to latch data. The following diagram depicts its timing diagram.

Figure 18-10. Timing diagram of NSS pulse with continuous transmission



SPI disabling sequence

Different sequences are used to disable the SPI in different operation modes.

MFD SFD

Wait for the last RBNE flag and then receive the last data. Confirm that TBE=1 and TRANS=0. At last, disable the SPI by clearing SPIEN bit.

MTU MTB STU STB

Write the last data into SPI_DATA and wait until the TBE flag is set and then wait until the TRANS flag is cleared. Disable the SPI by clearing SPIEN bit.

MRU MRB

After getting the second last RBNE flag, read out this data and delay for a SCK clock time and then, disable the SPI by clearing SPIEN bit. Wait until the last RBNE flag is set and read out the last data.

SRU SRB

Application can disable the SPI when it doesn't want to receive data, and then wait until the TRANS=0 to ensure the ongoing transfer completes.

TI mode

The disabling sequence of TI mode is the same as the sequences described above.

NSS pulse mode

The disabling sequence of NSSP mode is the same as the sequences described above.

18.3.6. DMA function

The DMA frees the application from data writing and reading process during transfer, to improve the system efficiency.

DMA function in SPI is enabled by setting DMATEN and DMAREN bits in SPI_CTL1 register. To use DMA function, application should first correctly configure DMA modules, then configure SPI module according to the initialization sequence, at last enable SPI.

After being enabled, if DMATEN is set, SPI will generate a DMA request each time when TBE=1, then DMA will acknowledge to this request and write data into the SPI_DATA register automatically. If DMAREN is set, SPI will generate a DMA request each time when RBNE=1, then DMA will acknowledge to this request and read data from the SPI_DATA register automatically.

18.3.7. CRC function

There are two CRC calculators in SPI: one for transmission and the other for reception. The CRC calculation uses the polynomial defined in SPI_CRCPOLY register.

Application can enable the CRC function by setting CRCEN bit in SPI_CTL0 register. The CRC calculators continuously calculate CRC for each bit transmitted and received on lines, and the calculated CRC values can be read from SPI_TCRC and SPI_RCRC registers.

To transmit the calculated CRC value, application should set the CRCNT bit in SPI_CTL0 register after the last data is written to the transmit buffer. In full-duplex mode (MFD or SFD), when the SPI transmits a CRC and prepares to check the received CRC value, the SPI treats the incoming data as a CRC value. In reception mode (MRB, MRU, SRU and SRB), the application should set the CRCNT bit after the second last data frame is received. When CRC checking fails, the CRCERR flag will be set.

If DMA function is enabled, application doesn't need to configure CRCNT bit and hardware will automatically process the CRC transmitting and checking.

Note: When SPI is in slave mode and CRC function is enable, the CRC calculator is sensitive to input SCK clock whether SPI is enable or not. The software must enable CRC only when the clock is stable to avoid wrong CRC calculation. And when SPI works as a slave, the NSS internal signal needs to be kept low between the data phase and CRC phase.

18.3.8. SPI interrupts

Status flags

- **Transmit buffer empty flag (TBE)**

This bit is set when the transmit buffer is empty, the software can write the next data to the transmit buffer by writing the SPI_DATA register.

- **Receive buffer not empty flag (RBNE)**

This bit is set when receive buffer is not empty, which means that one data is received and stored in the receive buffer, and software can read the data by reading the SPI_DATA register.

- **SPI transmitting ongoing flag (TRANS)**

TRANS is a status flag to indicate whether the transfer is ongoing or not. It is set and cleared by hardware and not controlled by software. This flag doesn't generate any interrupt.

Error flags

- **Configuration fault error (CONFERR)**

CONFERR is an error flag in master mode. In NSS hardware mode and if the NSSDRV is not enabled, the CONFERR is set when the NSS pin is pulled low. In NSS software mode, the CONFERR is set when the SWNSS bit is 0. When the CONFERR is set, the SPIEN bit and the MSTMOD bit are cleared by hardware, the SPI is disabled and the device is forced into slave mode.

The SPIEN and MSTMOD bits are write protected until the CONFERR is cleared. The CONFERR bit of the slave cannot be set. In a multi-master configuration, the device can be in slave mode with CONFERR bit set, which means there might have been a multi-master conflict for system control.

- **Rx overrun error (RXORERR)**

The RXORERR bit is set if a data is received when the RBNE is set. That means, the last data has not been read out and the newly incoming data is received. The receive buffer contents won't be covered with the newly incoming data, so the newly incoming data is lost.

- **Format error (FERR)**

In slave TI mode, the slave also monitors the NSS signal and set an error flag if it detects an incorrect NSS behavior, for example: toggles at the middle bit of a byte.

- **CRC error (CRCERR)**

When the CRCEN bit is set, the CRC calculation result of the received data in the SPI_RCRC register is compared with the received CRC value after the last data, the CRCERR is set when they are different.

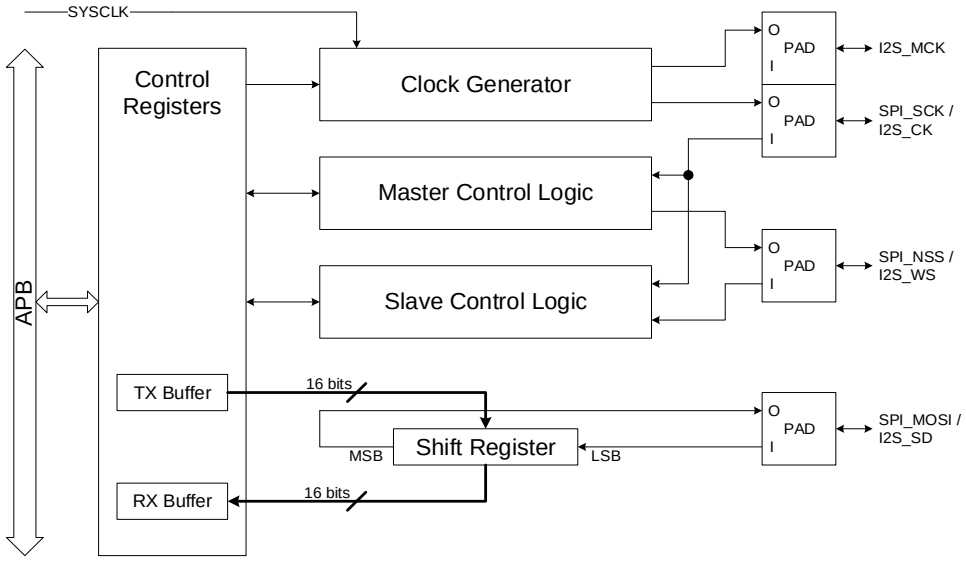
Table 18-5. SPI interrupt requests

Flag	Description	Clear method	Interrupt enable bit
TBE	Transmit buffer empty	Write SPI_DATA register.	TBEIE
RBNE	Receive buffer not empty	Read SPI_DATA register.	RBNEIE
CONFERR	Configuration fault error	Read or write SPI_STAT register, then write SPI_CTL0 register.	ERRIE
RXORERR	Rx overrun error	Read SPI_DATA register, then read SPI_STAT register.	
CRCERR	CRC error	Write 0 to CRCERR bit	
FERR	TI mode format error	Write 0 to FERR bit	

18.4. I2S function overview

18.4.1. I2S block diagram

Figure 18-11. Block diagram of I2S



There are five sub modules to support I2S function, including control registers, clock generator, master control logic, slave control logic and shift register. All the user configuration registers are implemented in the control registers module, including the TX buffer and RX buffer. The clock generator is used to produce I2S communication clock in master mode. The master control logic is implemented to generate the I2S_WS signal and control the communication in master mode. The slave control logic is implemented to control the communication in slave mode according to the received I2S_CK and I2S_WS. The shift register handles the serial data transmission and reception on I2S_SD.

18.4.2. I2S signal description

There are four pins on the I2S interface, including I2S_CK, I2S_WS, I2S_SD and I2S_MCK. I2S_CK is the serial clock signal, which shares the same pin with SPI_SCK. I2S_WS is the frame control signal, which shares the same pin with SPI_NSS. I2S_SD is the serial data signal, which shares the same pin with SPI_MOSI. I2S_MCK is the master clock signal. It produces a frequency rate equals to 256 x Fs, and Fs is the audio sampling frequency.

18.4.3. I2S audio standards

The I2S audio standard is selected by the I2SSTD bits in the SPI_I2SCTL register. Four audio standards are supported, including I2S Philips standard, MSB justified standard, LSB justified standard, and PCM standard. All standards except PCM handle audio data time-multiplexedly on two channels (the left channel and the right channel). For these standards, the I2S_WS signal indicates the channel side. For PCM standard, the I2S_WS signal indicates frame synchronization information.

The data length and the channel length are configured by the DTLEN bits and CHLEN bit in the SPI_I2SCTL register. Since the channel length must be greater than or equal to the data length, four packet types are available. They are 16-bit data packed in 16-bit frame, 16-bit data packed in 32-bit frame, 24-bit data packed in 32-bit frame, and 32-bit data packed in 32-bit frame. The data buffer for transmission and reception is 16-bit wide. In the case that the data length is 24 bits or 32 bits, two write or read operations to or from the SPI_DATA register are needed to complete the transmission of a frame. In the case that the data length is 16 bits, only one write or read operation to or from the SPI_DATA register is needed to complete the transmission of a frame. When using 16-bit data packed in 32-bit frame, 16-bit 0 is inserted by hardware automatically to extend the data to 32-bit format.

For all standards and packet types, the most significant bit (MSB) is always sent first. For all standards based on two channels time-multiplexed, the channel left is always sent first followed by the channel right.

I2S Philips standard

For I2S Philips standard, I2S_WS and I2S_SD are updated on the falling edge of I2S_CK, and I2S_WS becomes valid one clock before the data. The timing diagrams for each configuration are shown below.

Figure 18-12. I2S Philips standard timing diagram (DTLEN=00, CHLEN=0, CKPL=0)

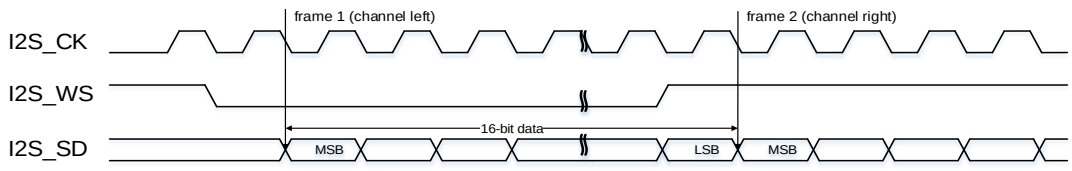


Figure 18-13. I2S Philips standard timing diagram (DTLEN=00, CHLEN=0, CKPL=1)

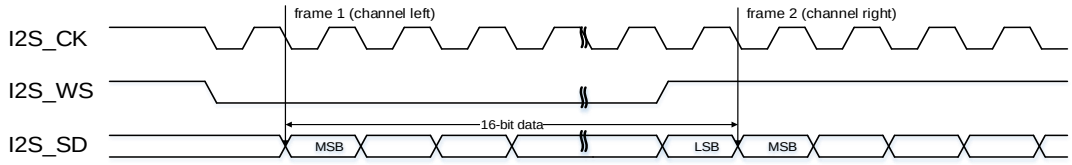

When the packet type is 16-bit data packed in 16-bit frame, only one write or read operation to or from the SPI_DATA register is needed to complete the transmission of a frame.

Figure 18-14. I2S Philips standard timing diagram (DTLEN=10, CHLEN=1, CKPL=0)

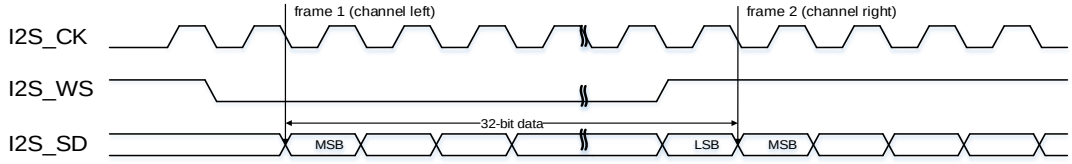

Figure 18-15. I2S Philips standard timing diagram (DTLEN=10, CHLEN=1, CKPL=1)

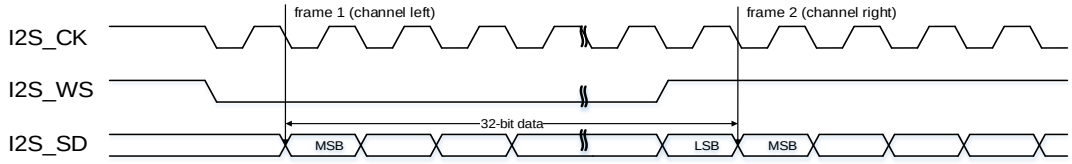

When the packet type is 32-bit data packed in 32-bit frame, two write or read operations to or from the SPI_DATA register are needed to complete the transmission of a frame. In transmission mode, if a 32-bit data is going to be sent, the first data written to the SPI_DATA register should be the higher 16 bits, and the second one should be the lower 16 bits. In reception mode, if a 32-bit data is received, the first data read from the SPI_DATA register should be the higher 16 bits, and the second one should be the lower 16 bits.

Figure 18-16. I2S Philips standard timing diagram (DTLEN=01, CHLEN=1, CKPL=0)

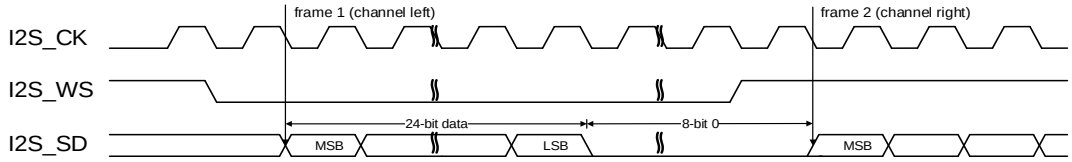

Figure 18-17. I2S Philips standard timing diagram (DTLEN=01, CHLEN=1, CKPL=1)

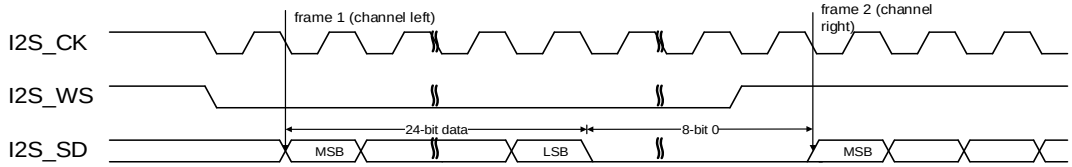

When the packet type is 24-bit data packed in 32-bit frame, two write or read operations to or from the SPI_DATA register are needed to complete the transmission of a frame. In transmission mode, if a 24-bit data D[23:0] is going to be sent, the first data written to the

SPI_DATA register should be the higher 16 bits D[23:8]. And the second one should be a 16-bit data, the higher 8 bits of this 16-bit data should be D[7:0] and the lower 8 bits can be any value. In reception mode, if a 24-bit data D[23:0] is received, the first data read from the SPI_DATA register is D[23:8]. And the second one is a 16-bit data, the higher 8 bits of this 16-bit data are D[7:0] and the lower 8 bits are zeros.

Figure 18-18. I2S Philips standard timing diagram (DTLEN=00, CHLEN=1, CKPL=0)

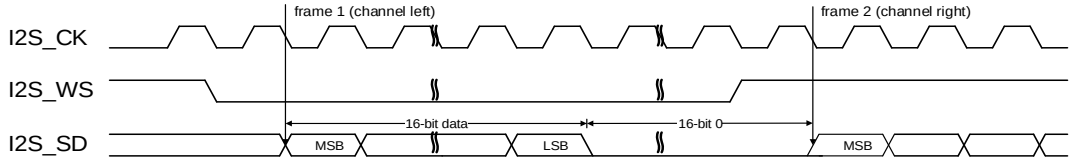

Figure 18-19. I2S Philips standard timing diagram (DTLEN=00, CHLEN=1, CKPL=1)

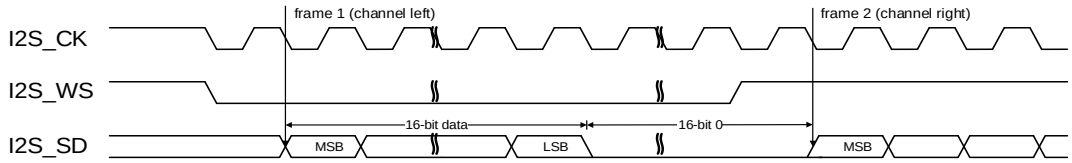

When the packet type is 16-bit data packed in 32-bit frame, only one write or read operation to or from the SPI_DATA register is needed to complete the transmission of a frame. The remaining 16 bits are forced by hardware to 0x0000 to extend the data to 32-bit format.

MSB justified standard

For MSB justified standard, I2S_WS and I2S_SD are updated on the falling edge of I2S_CK. The SPI_DATA register is handled in the exactly same way as that for I2S Philips standard. The timing diagrams for each configuration are shown below.

Figure 18-20. MSB justified standard timing diagram (DTLEN=00, CHLEN=0, CKPL=0)

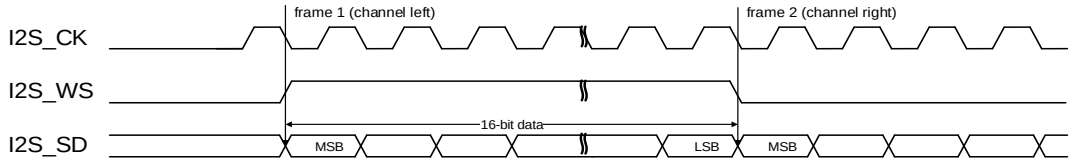

Figure 18-21. MSB justified standard timing diagram (DTLEN=00, CHLEN=0, CKPL=1)

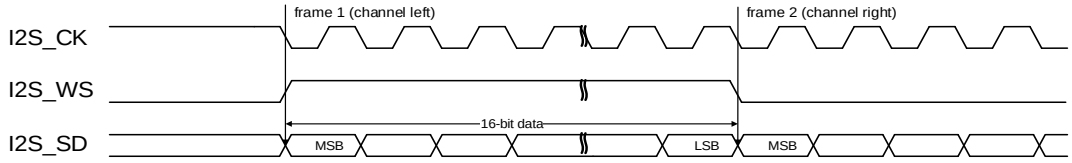

Figure 18-22. MSB justified standard timing diagram (DTLEN=10, CHLEN=1, CKPL=0)

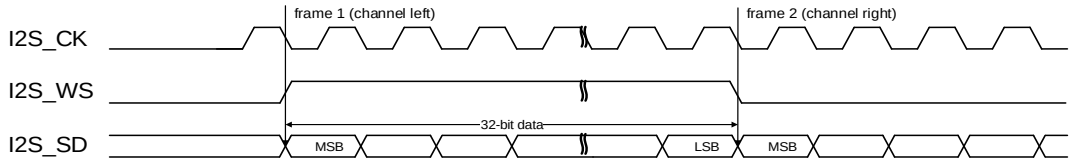

Figure 18-23. MSB justified standard timing diagram (DTLEN=10, CHLEN=1, CKPL=1)

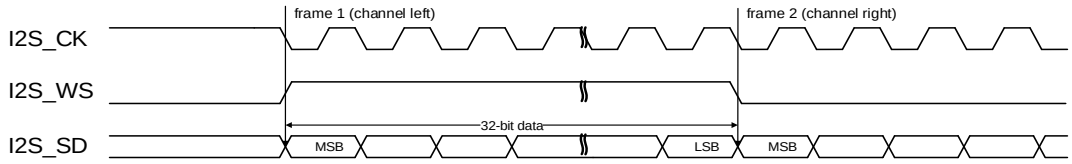

Figure 18-24. MSB justified standard timing diagram (DTLEN=01, CHLEN=1, CKPL=0)

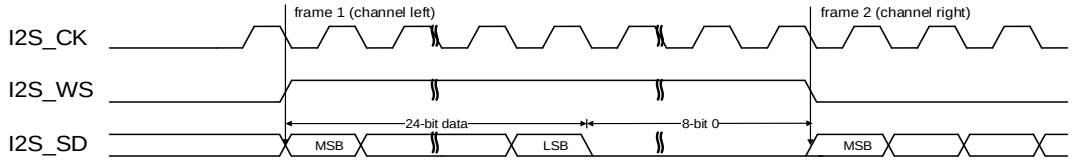

Figure 18-25. MSB justified standard timing diagram (DTLEN=01, CHLEN=1, CKPL=1)

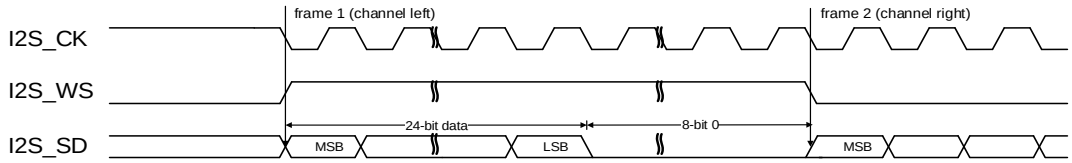

Figure 18-26. MSB justified standard timing diagram (DTLEN=00, CHLEN=1, CKPL=0)

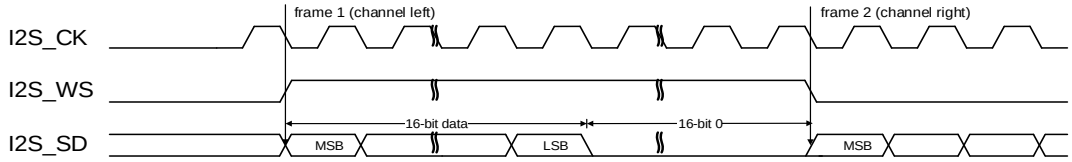

Figure 18-27. MSB justified standard timing diagram (DTLEN=00, CHLEN=1, CKPL=1)

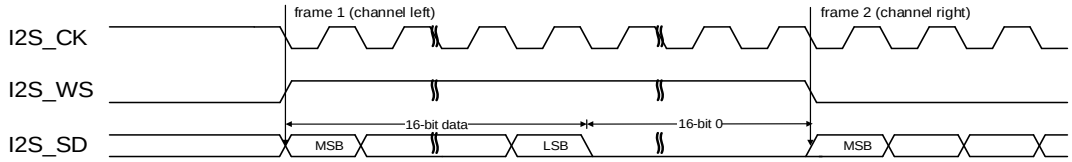

LSB justified standard

For LSB justified standard, I2S_WS and I2S_SD are updated on the falling edge of I2S_CK. In the case that the channel length is equal to the data length, LSB justified standard and MSB justified standard are exactly the same. In the case that the channel length is greater

than the data length, the valid data is aligned to LSB for LSB justified standard while the valid data is aligned to MSB for MSB justified standard. The timing diagrams for the cases that the channel length is greater than the data length are shown below.

Figure 18-28. LSB justified standard timing diagram (DTLEN=01, CHLEN=1, CKPL=0)

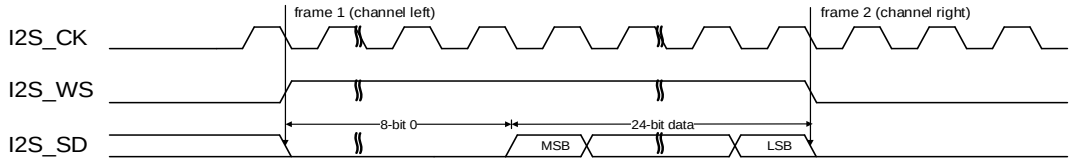

Figure 18-29. LSB justified standard timing diagram (DTLEN=01, CHLEN=1, CKPL=1)

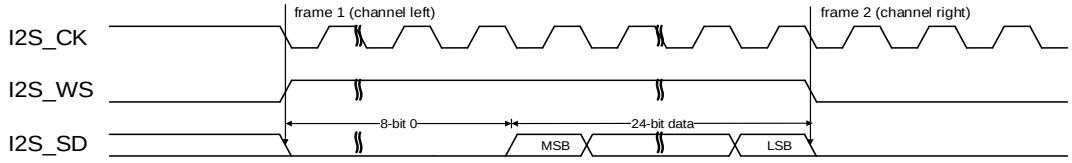

When the packet type is 24-bit data packed in 32-bit frame, two write or read operations to or from the SPI_DATA register are needed to complete the transmission of a frame. In transmission mode, if a 24-bit data D[23:0] is going to be sent, the first data written to the SPI_DATA register should be a 16-bit data. The higher 8 bits of the 16-bit data can be any value and the lower 8 bits should be D[23:16]. The second data written to the SPI_DATA register should be D[15:0]. In reception mode, if a 24-bit data D[23:0] is received, the first data read from the SPI_DATA register is a 16-bit data. The high 8 bits of this 16-bit data are zeros and the lower 8 bits are D[23:16]. The second data read from the SPI_DATA register is D[15:0].

Figure 18-30. LSB justified standard timing diagram (DTLEN=00, CHLEN=1, CKPL=0)

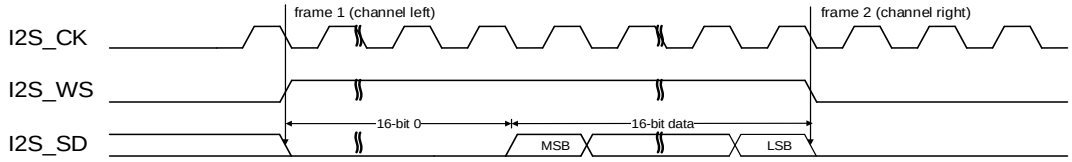

Figure 18-31. LSB justified standard timing diagram (DTLEN=00, CHLEN=1, CKPL=1)

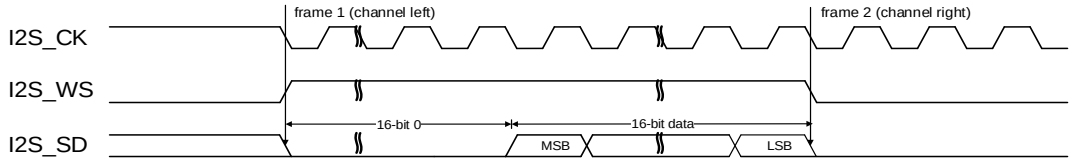

When the packet type is 16-bit data packed in 32-bit frame, only one write or read operation to or from the SPI_DATA register is needed to complete the transmission of a frame. The remaining 16 bits are forced by hardware to 0x0000 to extend the data to 32-bit format.

PCM standard

For PCM standard, I2S_WS and I2S_SD are updated on the rising edge of I2S_CK, and the I2S_WS signal indicates frame synchronization information. Both the short frame synchronization mode and the long frame synchronization mode are available and configurable using the PCMSMOD bit in the SPI_I2SCTL register. The SPI_DATA register is handled in the exactly same way as that for I2S Philips standard. The timing diagrams for each configuration of the short frame synchronization mode are shown below.

Figure 18-32. PCM standard short frame synchronization mode timing diagram (DTLEN=00, CHLEN=0, CKPL=0)

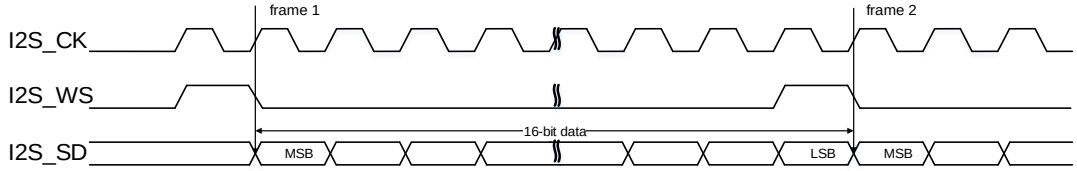

Figure 18-33. PCM standard short frame synchronization mode timing diagram (DTLEN=00, CHLEN=0, CKPL=1)

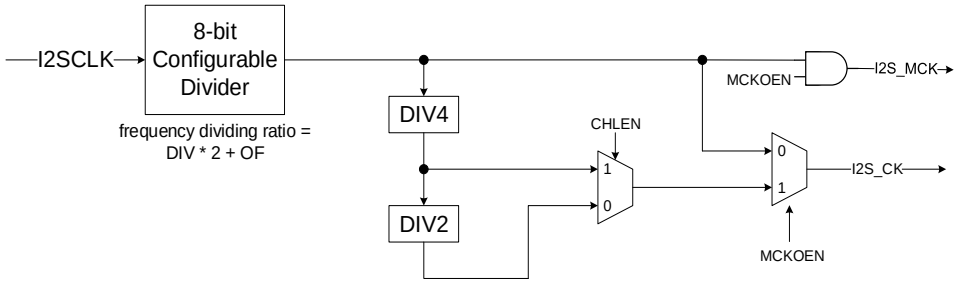
18.4.4. I2S clock

Figure 18-48. Block diagram of I2S clock generator



The block diagram of I2S clock generator is shown as ***Figure 18-48. Block diagram of I2S clock generator.*** The I2S interface clocks are configured by the DIV bits, the OF bit, the MCKOEN bit in the SPI_I2SPSC register and the CHLEN bit in the SPI_I2SCTL register. The source clock is the system clock(CK_SYS). The I2S bitrate can be calculated by the formulas shown in ***Table 18-6. I2S bitrate calculation formulas.***

Table 18-6. I2S bitrate calculation formulas

MCKOEN	CHLEN	Formula
0	0	I2SCLK / (DIV * 2 + OF)
0	1	I2SCLK / (DIV * 2 + OF)
1	0	I2SCLK / (8 * (DIV * 2 + OF))
1	1	I2SCLK / (4 * (DIV * 2 + OF))

The relationship between audio sampling frequency (Fs) and I2S bitrate is defined by the following formula:

Fs = I2S bitrate / (number of bits per channel * number of channels)

So, in order to get the desired audio sampling frequency, the clock generator needs to be configured according to the formulas listed in ***Table 18-7. Audio sampling frequency calculation formulas.***

Table 18-7. Audio sampling frequency calculation formulas

MCKOEN	CHLEN	Formula
0	0	I2SCLK / (32 * (DIV * 2 + OF))
0	1	I2SCLK / (64 * (DIV * 2 + OF))
1	0	I2SCLK / (256 * (DIV * 2 + OF))
1	1	I2SCLK / (256 * (DIV * 2 + OF))

Note: The configuration value of the I2S serial clock must be set to less than 1/6 of the PCLK clock (excluding 1/6).

18.4.5. Operation

Operation modes

The operation mode is selected by the I2SOPMOD bits in the SPI_I2SCTL register. There are four available operation modes, including master transmission mode, master reception mode, slave transmission mode, and slave reception mode. The direction of I2S interface signals for each operation mode is shown in the ***Table 18-8. Direction of I2S interface signals for each operation mode .***

Table 18-8. Direction of I2S interface signals for each operation mode

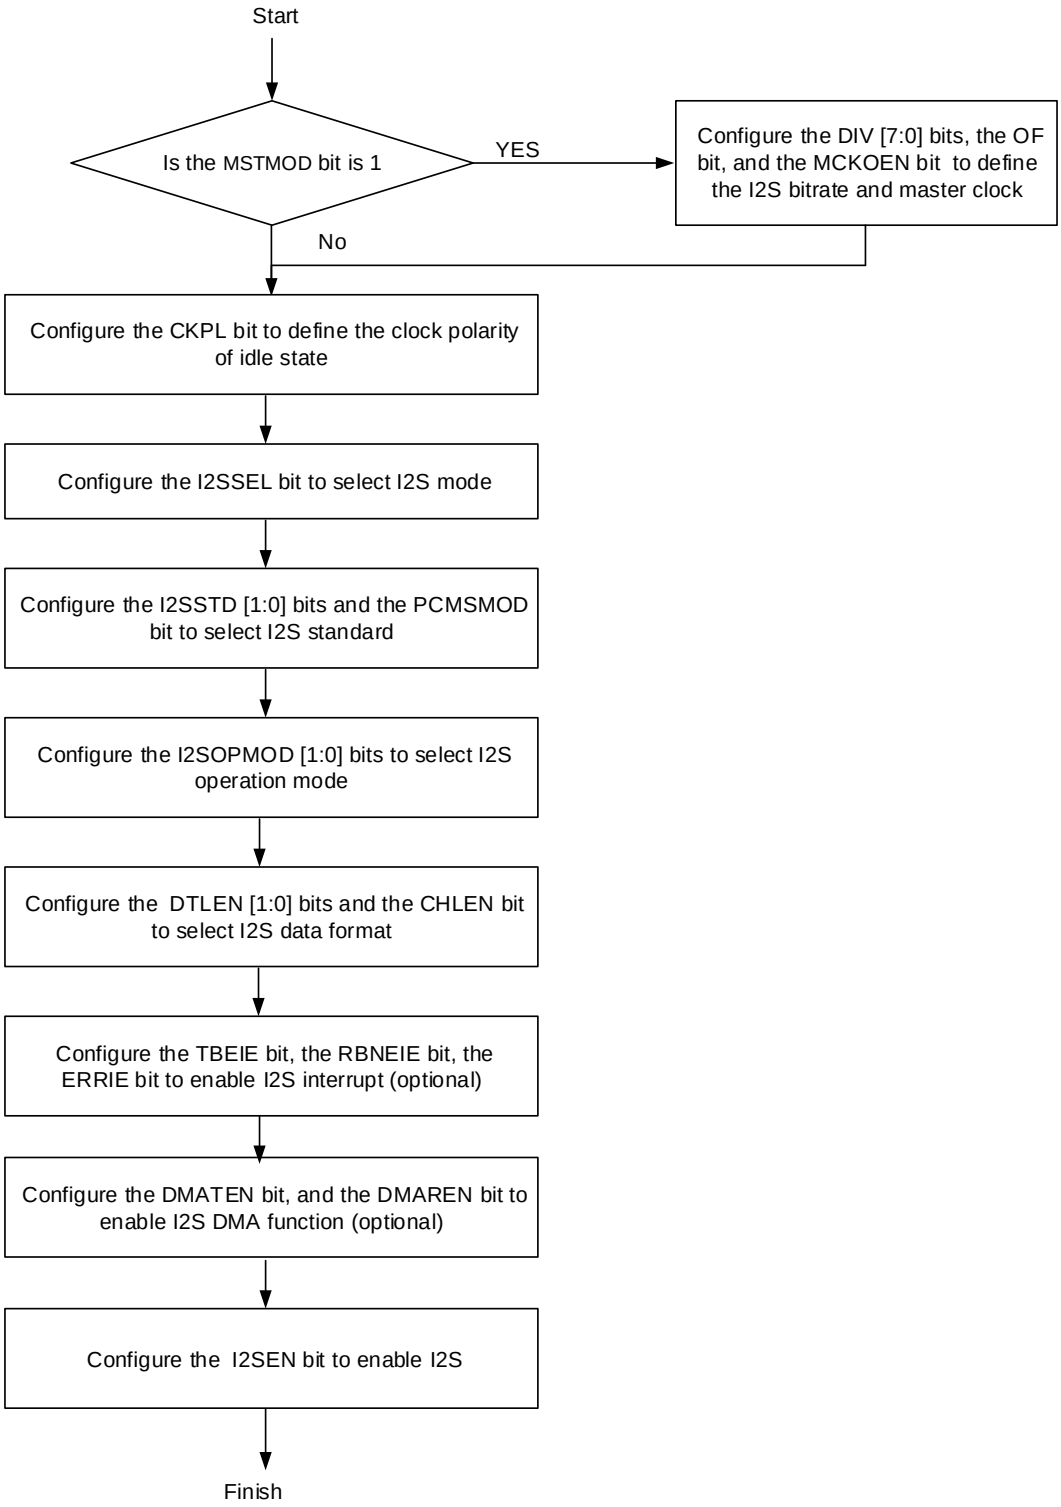
Operation mode	I2S_MCK	I2S_CK	I2S_WS	I2S_SD
Master transmission	Output or NU(1)	Output	Output	Output
Master reception	Output or NU(1)	Output	Output	Input
Slave transmission	Input or NU(1)	Input	Input	Output
Slave reception	Input or NU(1)	Input	Input	Input

1. NU means the pin is not used by I2S and can be used by other functions.

I2S initialization sequence

I2S initialization sequence is shown as below ***Figure 18-49. I2S initialization sequence***.

Figure 18-49. I2S initialization sequence



I2S master transmission sequence

The TBE flag is used to control the transmission sequence. As is mentioned before, the TBE flag indicates that the transmit buffer is empty, and an interrupt will be generated if the TBEIE

bit in the SPI_CTL1 register is set. At the beginning, the transmit buffer is empty (TBE is high) and no transmission sequence is processing in the shift register. When a half word is written to the SPI_DATA register (TBE goes low), the data is transferred from the transmit buffer to the shift register (TBE goes high) immediately. At the moment, the transmission sequence begins.

The data is parallel loaded into the 16-bit shift register, and shifted out serially to the I2S_SD pin, MSB first. The next data should be written to the SPI_DATA register, when the TBE flag is high. After a write operation to the SPI_DATA register, the TBE flag goes low. When the current transmission finishes, the data in the transmit buffer is loaded into the shift register, and the TBE flag goes back high. Software should write the next audio data into SPI_DATA register before the current data finishes, otherwise, the audio data transmission is not continuous.

For all standards except PCM, the I2SCH flag is used to distinguish which channel side the data to transfer belongs to. The I2SCH flag is refreshed at the moment when the TBE flag goes high. At the beginning, the I2SCH flag is low, indicating the left channel data should be written to the SPI_DATA register.

In order to disable I2S, it is mandatory to clear the I2SEN bit after the TBE flag is high and the TRANS flag is low.

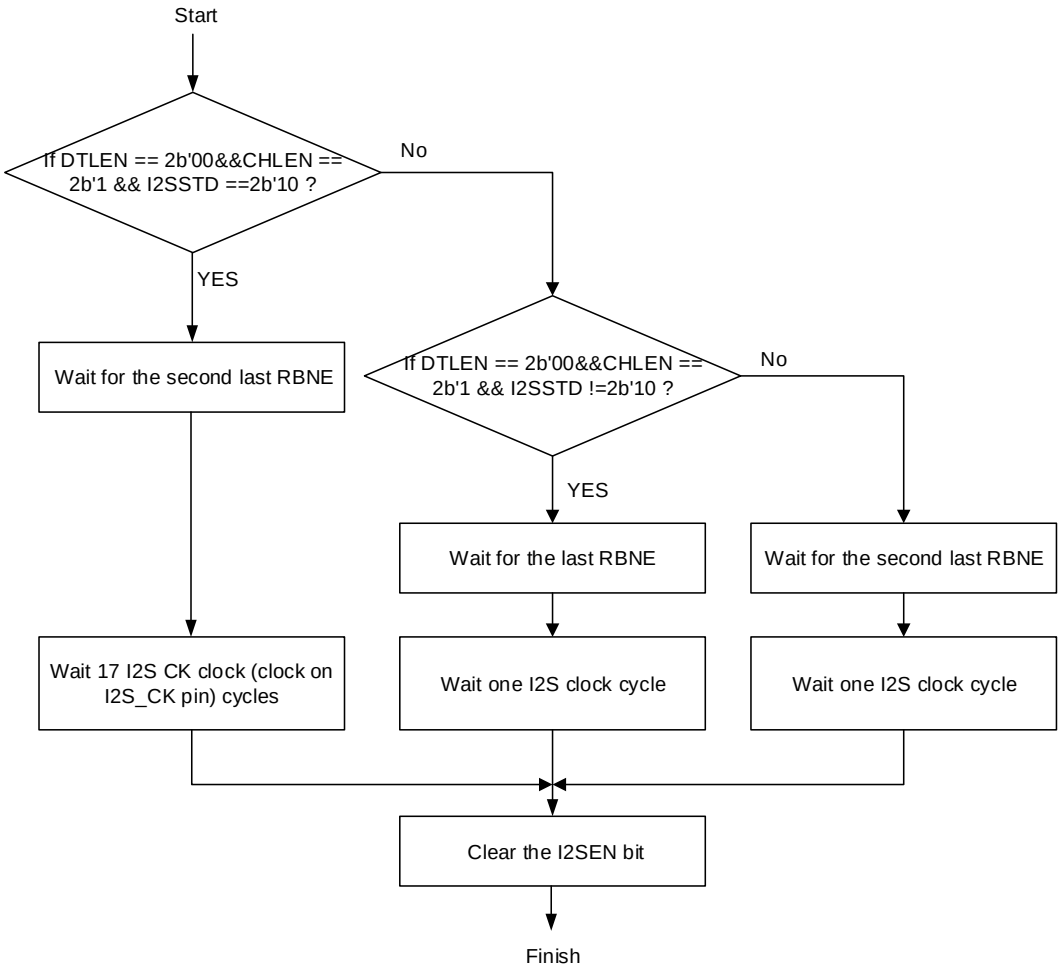
I2S master reception sequence

The RBNE flag is used to control the reception sequence. As is mentioned before, the RBNE flag indicates the receive buffer is not empty, and an interrupt will be generated if the RBNEIE bit in the SPI_CTL1 register is set. The reception sequence begins immediately when the I2SEN bit in the SPI_I2SCTL register is set. At the beginning, the receive buffer is empty (RBNE is low). When a reception sequence finishes, the received data in the shift register is loaded into the receive buffer (RBNE goes high). The data should be read from the SPI_DATA register, when the RBNE flag is high. After a read operation to the SPI_DATA register, the RBNE flag goes low. It is mandatory to read the SPI_DATA register before the end of the next reception. Otherwise, reception overrun error occurs. The RXORERR flag is set and an interrupt may be generated if the ERRIE bit in the SPI_CTL1 register is set. In this case, it is necessary to disable and then enable I2S before resuming the communication.

For all standards except PCM, the I2SCH flag is used to distinguish which channel side the received data belongs to. The I2SCH flag is refreshed at the moment when the RBNE flag goes high.

Different sequences are used to disable the I2S in different standards, data length and channel length. The sequences for each case are shown as below ***Figure 18-50. I2S master reception disabling sequence***.

Figure 18-50. I2S master reception disabling sequence



I2S slave transmission sequence

The transmission sequence in slave mode is similar to that in master mode. The differences between them are described below.

In slave mode, the slave has to be enabled before the external master starts the communication. The transmission sequence begins when the external master sends the clock and when the I2S_WS signal requests the transfer of data. The data has to be written to the SPI_DATA register before the master initiates the communication. Software should write the next audio data into SPI_DATA register before the current data finishes. Otherwise, transmission underrun error occurs. The TXURERR flag is set and an interrupt may be generated if the ERRIE bit in the SPI_CTL1 register is set. In this case, it is mandatory to disable and enable I2S to resume the communication. In slave mode, I2SCH is sensitive to the I2S_WS signal coming from the external master.

In order to disable I2S, it is mandatory to clear the I2SEN bit after the TBE flag is high and the TRANS flag is low.

I2S slave reception sequence

The reception sequence in slave mode is similar to that in master mode. The differences between them are described below.

In slave mode, the slave has to be enabled before the external master starts the communication. The reception sequence begins when the external master sends the clock and when the I2S_WS signal indicates a start of the data transfer. In slave mode, I2SCH is sensitive to the I2S_WS signal coming from the external master.

In order to disable I2S, it is mandatory to clear the I2SEN bit immediately after receiving the last RBNE.

18.4.6. DMA function

DMA function is the same as SPI mode. The only difference is that the CRC function is not available in I2S mode.

18.4.7. I2S interrupts

Status flags

There are four status flags implemented in the SPI_STAT register, including TBE, RBNE, TRANS and I2SCH. The user can use them to fully monitor the state of the I2S bus.

- **Transmit buffer empty flag (TBE)**

This bit is set when the transmit buffer is empty, the software can write the next data to the transmit buffer by writing the SPI_DATA register.

- **Receive buffer not empty flag (RBNE)**

This bit is set when receive buffer is not empty, which means that one data is received and stored in the receive buffer, and software can read the data by reading the SPI_DATA register.

- **I2S transmitting ongoing flag (TRANS)**

TRANS is a status flag to indicate whether the transfer is ongoing or not. It is set and cleared by hardware and not controlled by software. This flag will not generate any interrupt.

- **I2S channel side flag (I2SCH)**

This flag indicates the channel side information of the current transfer and has no meaning in PCM mode. It is updated when TBE rises in transmission mode or RBNE rises in reception mode. This flag will not generate any interrupt.

Error flags

There are three error flags:

- **Transmission underrun error flag (TXURERR)**

This situation occurs when the transmit buffer is empty and the valid SCK signal starts in slave transmission mode.

- **Reception overrun error flag (RXORERR)**

This situation occurs when the receive buffer is full and a newly incoming data has been completely received. When overrun occurs, the data in receive buffer is not updated and the newly incoming data is lost.

- **Format error (FERR)**

In slave I2S mode, the I2S monitors the I2S_WS signal and an error flag will be set if I2S_WS toggles at an unexpected position.

I2S interrupt events and corresponding enable bits are summed up in the ***Table 18-9. I2S interrupt .***

Table 18-9. I2S interrupt

Interrupt flag	Description	Clear method	Interrupt enable bit
TBE	Transmit buffer empty	Write SPI_DATA register	TBEIE
RBNE	Receive buffer not empty	Read SPI_DATA register	RBNEIE
TXURERR	Transmission underrun error	Read SPI_STAT register	ERRIE
RXORERR	Reception overrun error	Read SPI_DATA register and then read SPI_STAT register.	
FERR	I2S format error	Read SPI_STAT register	

18.5. Register definition

SPI0 base address: 0x4001 3000

SPI1/I2S1 base address: 0x4000 3800

SPI2/I2S2 base address: 0x4000 3C00

18.5.1. Control register 0 (SPI_CTL0)

Address offset: 0x00
Reset value: 0x0000 0000

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).
This register has no meaning in I2S mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15	BDEN	Bidirectional enable 0: 2 line unidirectional transmit mode 1: 1 line bidirectional transmit mode. The information transfers between the MOSI pin in master and the MISO pin in slave.
14	BDOEN	Bidirectional transmit output enable When BDEN is set, this bit determines the direction of transfer. 0: Work in receive-only mode 1: Work in transmit-only mode
13	CRCEN	CRC calculation enable 0: Disable CRC calculation. 1: Enable CRC calculation.
12	CRCNT	CRC next transfer 0: Next transfer is data 1: Next transfer is CRC value (TCRC) When the transfer is managed by DMA, CRC value is transferred by hardware. This bit should be cleared. In full-duplex or transmit-only mode, set this bit after the last data is written to

		SPI_DATA register. In receive-only mode, set this bit after the second last data is received.
11	FF16	Data frame format 0: 8-bit data frame format 1: 16-bit data frame format
10	RO	Receive only mode When BDEN is cleared, this bit determines the direction of transfer. 0: Full-duplex mode 1: Receive-only mode
9	SWNSSEN	NSS software mode enable 0: NSS hardware mode. The NSS level depends on NSS pin. 1: NSS software mode. The NSS level depends on SWNSS bit. This bit has no meaning in SPI TI mode.
8	SWNSS	NSS pin selection in NSS software mode 0: NSS pin is pulled low 1: NSS pin is pulled high This bit effects only when the SWNSSEN bit is set. This bit has no meaning in SPI TI mode.
7	LF	LSB first mode 0: Transmit MSB first 1: Transmit LSB first This bit has no meaning in SPI TI mode.
6	SPIEN	SPI enable 0: Disable SPI peripheral. 1: Enable SPI peripheral.
5:3	PSC[2:0]	Master clock prescaler selection 000: PCLK/2 001: PCLK/4 010: PCLK/8 011: PCLK/16 100: PCLK/32 101: PCLK/64 110: PCLK/128 111: PCLK/256 PCLK means PCLK2 when using SPI0 or PCLK1 when using SPI1 and SPI2.
2	MSTMOD	Master mode enable 0: Slave mode 1: Master mode

1	CKPL	Clock polarity selection 0: CLK pin is pulled low when SPI is idle 1: CLK pin is pulled high when SPI is idle
0	CKPH	Clock phase selection 0: Capture the first data at the first clock transition 1: Capture the first data at the second clock transition

18.5.2. Control register 1 (SPI_CTL1)

Address offset: 0x04

Reset value: 0x0000 0000

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits	Fields	Descriptions
31:9	Reserved	Must be kept at reset value.
8	FERR	Format error SPI TI Mode: 0: No TI mode format error 1: TI mode format error occurs I2S Mode: 0: No I2S format error 1: I2S format error occurs This bit is set by hardware and cleared by writing 0.
7	TRANS	Transmitting ongoing bit 0: SPI or I2S is idle. 1: SPI or I2S is currently transmitting and/or receiving a frame This bit is set and cleared by hardware.
6	RXORERR	Reception overrun error bit 0: No reception overrun error occurs. 1: Reception overrun error occurs.

		This bit is set by hardware and cleared by a read operation on the SPI_DATA register followed by a read access to the SPI_STAT register.
5	CONFERR	SPI configuration error 0: No configuration fault occurs. 1: Configuration fault occurred. (In master mode, the NSS pin is pulled low in NSS hardware mode or SWNSS bit is low in NSS software mode.) This bit is set by hardware and cleared by a read operation on the SPI_CTL0 register followed by a read or write access to the SPI_STAT register. This bit is not used in I2S mode.
4	CRCERR	SPI CRC error bit 0: The SPI_RCRC value is equal to the received CRC data at last. 1: The SPI_RCRC value is not equal to the received CRC data at last. This bit is set by hardware and cleared by writing 0. This bit is not used in I2S mode.
3	TXURERR	Transmission underrun error bit 0: No transmission underrun error occurs. 1: Transmission underrun error occurs. This bit is set by hardware and cleared by a read operation on the SPI_STAT register. This bit is not used in SPI mode.
2	I2SCH	I2S channel side 0: The next data needs to be transmitted or the data just received is channel left. 1: The next data needs to be transmitted or the data just received is channel right. This bit is set and cleared by hardware. This bit is not used in SPI mode, and has no meaning in the I2S PCM mode.
1	TBE	Transmit buffer empty 0: Transmit buffer is not empty 1: Transmit buffer is empty
0	RBNE	Receive buffer not empty 0: Receive buffer is empty 1: Receive buffer is not empty

18.5.4. Data register (SPI_DATA)

Address offset: 0x0C
Reset value: 0x0000 0000

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SPI_DATA[15:0]															
rw															

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	SPI_DATA[15:0]	Data transfer register The hardware has two buffers, including transmit buffer and receive buffer. Write data to SPI_DATA will save the data to transmit buffer and read data from SPI_DATA will get the data from receive buffer. When the data frame format is set to 8-bit data, the SPI_DATA [15:8] is forced to 0 and the SPI_DATA[7:0] is used for transmission and reception, transmit buffer and receive buffer are 8-bit. If the data frame format is set to 16-bit data, the SPI_DATA[15:0] is used for transmission and reception, transmit buffer and receive buffer are 16-bit.

18.5.5. CRC polynomial register (SPI_CRCPOLY)

Address offset: 0x10

Reset value: 0x0000 0007

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CRCPOLY[15:0]															
rw															

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	CRCPOLY[15:0]	CRC polynomial value These bits contain the CRC polynomial and they are used for CRC calculation. The default value is 0007h.

18.5.6. RX CRC register (SPI_RCRC)

Address offset: 0x14

Reset value: 0x0000 0000

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RCRC[15:0]															
r															

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	RCRC[15:0]	RX CRC value When the CRCEN bit of SPI_CTL0 is set, the hardware computes the CRC value of the received bytes and saves them in RCRC register. If the data frame format is set to 8-bit data, CRC calculation is based on CRC8 standard, and saves the value in RCRC[7:0], when the data frame format is set to 16-bit data, CRC calculation is based on CRC16 standard, and saves the value in RCRC[15:0]. The hardware computes the CRC value after each received bit, when the TRANS is set, a read to this register could return an intermediate value. This register is reset when the CRCEN bit in SPI_CTL0 register or the SPIxRST bit in RCU reset register is set.

18.5.7. TX CRC register (SPI_TCRC)

Address offset: 0x18

Reset value: 0x0000 0000

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TCRC[15:0]															
r															

Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15:0	TCRC[15:0]	TX CRC value When the CRCEN bit of SPI_CTL0 is set, the hardware computes the CRC value of the transmitted bytes and saves them in TCRC register. If the data frame format is set to 8-bit data, CRC calculation is based on CRC8 standard, and saves the value in TCRC[7:0], when the data frame format is set to 16-bit data, CRC calculation is based on CRC16 standard, and saves the value in TCRC[15:0]. The hardware computes the CRC value after each transmitted bit, when the TRANS is set, a read to this register could return an intermediate value. The different frame formats (LF bit of the SPI_CTL0) will get different CRC values.

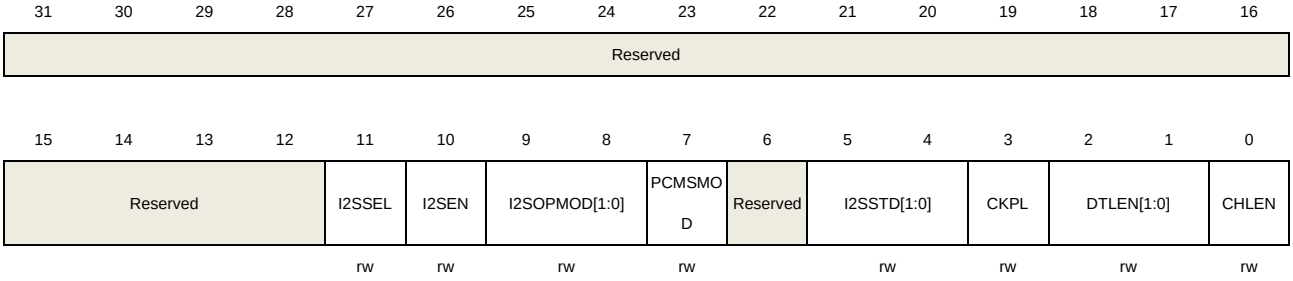
This register is reset when the CRCEN bit in SPI_CTL0 register or the SPIxRST bit in RCU reset register is set.

18.5.8. I2S control register (SPI_I2SCTL)

Address offset: 0x1C

Reset value: 0x0000 0000

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).



Bits	Fields	Descriptions
31:12	Reserved	Must be kept at reset value.
11	I2SSEL	I2S mode selection 0: SPI mode 1: I2S mode This bit should be configured when SPI/I2S is disabled.
10	I2SEN	I2S enable 0: Disable I2S 1: Enable I2S This bit is not used in SPI mode.
9:8	I2SOPMOD[1:0]	I2S operation mode 00: Slave transmission mode 01: Slave reception mode 10: Master transmission mode 11: Master reception mode This bit should be configured when I2S is disabled. This bit is not used in SPI mode.
7	PCMSMOD	PCM frame synchronization mode 0: Short frame synchronization 1: Long frame synchronization This bit has a meaning only when PCM standard is used. This bit should be configured when I2S is disabled. This bit is not used in SPI mode.
6	Reserved	Must be kept at reset value.

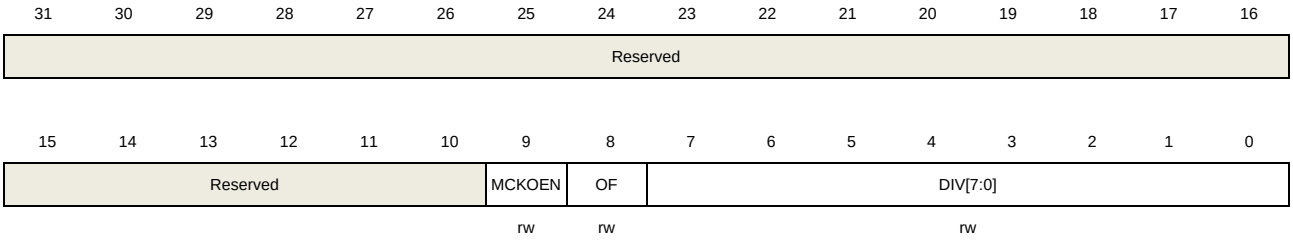
5:4	I2SSTD[1:0]	I2S standard selection 00: I2S Philips standard 01: MSB justified standard 10: LSB justified standard 11: PCM standard These bits should be configured when I2S is disabled. These bits are not used in SPI mode.
3	CKPL	Idle state clock polarity 0: The idle state of I2S_CK is low level 1: The idle state of I2S_CK is high level This bit should be configured when I2S is disabled. This bit is not used in SPI mode.
2:1	DTLEN[1:0]	Data length 00: 16 bits 01: 24 bits 10: 32 bits 11: Reserved These bits should be configured when I2S mode is disabled. These bits are not used in SPI mode.
0	CHLEN	Channel length 0: 16 bits 1: 32 bits The channel length must be equal to or greater than the data length. This bit should be configured when I2S mode is disabled. This bit is not used in SPI mode.

18.5.9. I2S clock prescaler register (SPI_I2SPSC)

Address offset: 0x20

Reset value: 0x0000 0002

This register can be accessed by byte (8-bit) or half-word (16-bit) or word (32-bit).



Bits	Fields	Descriptions
31:10	Reserved	Must be kept at reset value.
9	MCKOEN	I2S_MCK output enable

		0: Disable I2S_MCK output 1: Enable I2S_MCK output This bit should be configured when I2S mode is disabled. This bit is not used in SPI mode.
8	OF	Odd factor for the prescaler 0: Real divider value is DIV * 2 1: Real divider value is DIV * 2 + 1 This bit should be configured when I2S mode is disabled. This bit is not used in SPI mode.
7:0	DIV[7:0]	Dividing factor for the prescaler Real divider value is DIV * 2 + OF. DIV must not be 0. These bits should be configured when I2S mode is disabled. These bits are not used in SPI mode.

19. External memory controller (EXMC)

19.1. Overview

The external memory controller EXMC, is used as a translator for MCU to access a variety of external memory, it automatically converts AMBA memory access protocol into a specific memory access protocol defined in the configuration register, such as SRAM, ROM and NOR Flash. Users could also tweak with the timing parameters in the configuration registers to boost up memory access efficiency. EXMC access space is divided into multiple banks; each bank is assigned to access a specific memory type with flexible parameter configuration as defined in the control registers.

19.2. Characteristics

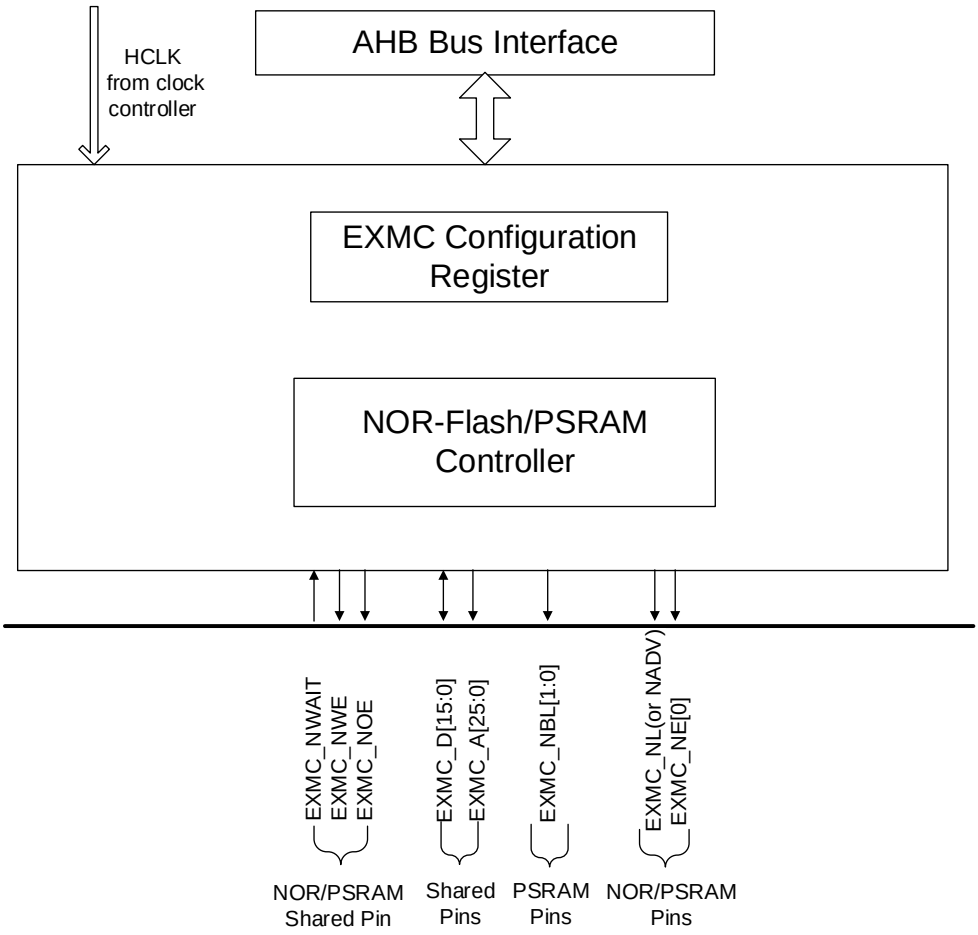
- Supported external memory:
  - SRAM
  - PSRAM
  - ROM
  - NOR Flash
- Protocol translation between the AMBA and the multitude of external memory protocol.
- Offering a variety of programmable timing parameters to meet user's specific needs.
- Independent read/write timing configuration to a sub-set memory type.
- 8 or 16 bits bus width.
- Address and data bus multiplexing mechanism for NOR Flash and PSRAM.
- Write enable and byte select are provided as needed.
- Automatic AMBA transaction split when internal and external bus width is not compatible.

19.3. Function overview

19.3.1. Block diagram

EXMC is the combination of four modules: The AHB bus interface, EXMC configuration registers, NOR/PSRAM controller, AHB clock (HCLK) is the reference clock.

Figure 19-1. The EXMC block diagram



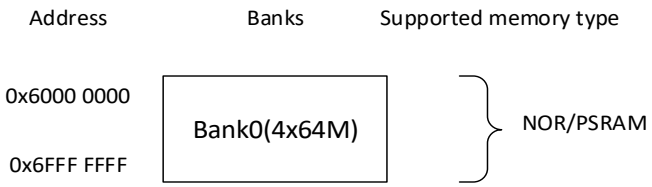
19.3.2. Basic regulation of EXMC access

EXMC is the conversion interface between AHB bus and external device protocol. 32-bit of AHB read/write accesses can be split into several consecutive 8-bit or 16-bit read/write operations respectively. In the process of data transfer, AHB access data width and memory data width may not be the same. In order to ensure consistency of data transmission, EXMC's read/write accesses follow the following basic regulation.

- When the width of AHB bus equals to the memory bus width. No conversion is applied.
- When the width of AHB bus is greater than memory bus width. The AHB accesses are automatically split into several continuous memory accesses.
- When the width of AHB bus is smaller than memory bus width. If the external memory devices have the byte selection function, such as SRAM, ROM, PSRAM, the application can access the corresponding byte through their byte lane EXMC_NBL[1:0]. Otherwise, write operation is prohibited, but read operation is allowed unconditionally.

19.3.3. External device address mapping

Figure 19-2. EXMC memory banks



EXMC access space is divided into one bank. Bank0 is 4*64 Mbytes. The first bank (Bank0) is further divided into 4 Regions, which is 64 Mbytes (only Bank0 Region0 is used).

Each bank or region has a separate chip-select control signal, which can be configured independently.

Bank0 is used for NOR and PSRAM device access.

NOR/PSRAM address mapping

Figure 19-3. Region of bank0 address mapping reflects the address mapping of the region of bank0. Internal AHB address lines HADDR[27:26] bits are used to select the region, but only region0 is supported.

Figure 19-3. Region of bank0 address mapping

HADDR[25:0] is the byte address whereas the external memory may not be byte accessed, this will lead to address inconsistency. EXMC can adjust HADDR to accommodate the data width of the external memory according to the following rules.

- When data bus width of the external memory is 8-bits. In this case the memory address is byte aligned. HADDR[25:0] is connected to EXMC_A[25:0] and then the EXMC_A[25:0] is connected to the external memory address lines.
- When data bus width of the external memory is 16-bits. In this case the memory address is half-word aligned. HADDR byte address must be converted into half-word aligned by connecting HADDR[25:1] with EXMC_A[24:0]. The EXMC_A[24:0] is connected to the external memory address lines.

19.3.4. NOR/PSRAM controller

NOR/PSRAM memory controller controls bank0, which is designed to support NOR Flash,

PSRAM, SRAM, ROM and honeycomb RAM external memory. EXMC has 1 independent chip-select signals for 1 sub-bank within bank0, named NE[0]. Other signals for NOR/PSRAM access are shared. Each sub-bank has its own set of configuration register.

Note:

In asynchronous mode, all output signals of controller will change on the rise edge of internal AHB bus clock (HCLK).

NOR/PSRAM memory device interface description

Table 19-1. NOR Flash interface signals description

EXMC Pin	Direction	Mode	Functional description
Muxed EXMC_A[25:16]	Output	Async	Address bus signal
EXMC_D[15:0]	Input/output	Async	Address/Data bus
EXMC_NE[x]	Output	Async	Chip selection, x=0
EXMC_NOE	Output	Async	Read enable
EXMC_NWE	Output	Async	Write enable
EXMC_NWAIT	Input	Async	Wait input signal
EXMC_NL(NADV)	Output	Async	Address valid

Table 19-2. PSRAM muxed signal description

EXMC Pin	Direction	Mode	Functional description
EXMC_A[25:16]	Output	Async	Address Bus
EXMC_D[15:0]	Input/output	Async	Data Bus
EXMC_NE[x]	Output	Async	Chip selection, x=0
EXMC_NOE	Output	Async	Read enable
EXMC_NWE	Output	Async	Write enable
EXMC_NWAIT	Input	Async	Wait input signal
EXMC_NL(NADV)	Output	Async	Latch enable (address valid enable, NADV)
EXMC_NBL[1]	Output	Async	Upper byte enable
EXMC_NBL[0]	Output	Async	Lower byte enable

Supported memory access mode

Table below shows an example of the supported devices type, access modes and transactions when the memory data bus is 16-bit for NOR, PSRAM and SRAM.

Table 19-3. EXMC bank 0 supports all transactions

Memory	Access Mode	R/W	AHB Transaction Size	Memory Transaction Size	Comments
NOR Flash	Async	R	8	16	
	Async	R	16	16	

Memory	Access Mode	R/W	AHB Transaction Size	Memory Transaction Size	Comments
	Async	W	16	16	
	Async	R	32	16	Split into 2 EXMC accesses
	Async	W	32	16	Split into 2 EXMC accesses
PSRAM	Async	R	8	16	
	Async	W	8	16	Use of byte lanes EXMC_NBL[1:0]
	Async	R	16	16	
	Async	W	16	16	
	Async	R	32	16	Split into 2 EXMC accesses
	Async	W	32	16	Split into 2 EXMC accesses
SRAM and ROM	Async	R	8	8	
	Async	R	8	16	
	Async	R	16	8	Split into 2 EXMC accesses
	Async	R	16	16	
	Async	R	32	8	Split into 4 EXMC accesses
	Async	R	32	16	Split into 2 EXMC accesses
	Async	W	8	8	
	Async	W	8	16	Use of byte lanes EXMC_NBL[1:0]
	Async	W	16	8	
	Async	W	16	16	
	Async	W	32	8	
	Async	W	32	16	

NOR Flash/PSRAM controller timing

EXMC provides various programmable timing parameters and timing models for SRAM, ROM, PSRAM, NOR Flash and other external static memory.

Table 19-4. NOR / PSRAM controller timing parameters

Parameter	Function	Access mode	Unit	Min	Max
BUSLAT	Bus latency	Async read	HCLK	1	16
DSET	Data setup time	Async	HCLK	2	256

Parameter	Function	Access mode	Unit	Min	Max
AHLD	Address hold time	Async(muxed)	HCLK	2	16
ASET	Address setup time	Async	HCLK	1	16

Table 19-5. EXMC_timing models

Timing model		Extend mode	Mode description	Write timing parameter	Read timing parameter
Async	Mode AM	0	NOR Flash address/data mux	DSET AHLD ASET BUSLAT	DSET AHLD ASET BUSLAT

As shown in ***Table 19-5. EXMC_timing models***, EXMC NOR Flash / PSRAM controller provides a timing model, users can modify those parameters listed in ***Table 19-4. NOR / PSRAM controller timing parameters*** to satisfy different external memory type and user's requirements. Different timing patterns for read and write access could be generated independently according to EXMC_SNTCFGx register's configuration.

Asynchronous access timing diagram

Mode AM - NOR Flash address / data bus multiplexing

3-0	ASET	Depends on memory and user

Wait timing of asynchronous communication

Wait feature is controlled by the bit ASYNCWAIT in register EXMC_SNCTLx. During extern memory access, data setup phase will be automatically extended by the active EXMC_NWAIT signal if ASYNCWAIT bit is set. The extend time is calculated as follows:

If memory wait signal is aligned to EXMC_NOE/ EXMC_NWE:

$$T_{DATA\_SETUP} \geq maxT_{WAIT\_ASSERTION} + 4HCLK$$

If memory wait signal is aligned to EXMC_NE:

If $maxT_{WAIT\_ASSERTION} \geq T_{ADDRES\_PHASE} + T_{HOLD\_PHASE}$

$$T_{DATA\_SETUP} \geq (maxT_{WAIT\_ASSERTION} - T_{ADDRES\_PHASE} - T_{HOLD\_PHASE}) + 4HCLK$$

Otherwise

$$T_{DATA\_SETUP} \geq 4HCLK$$

Figure 19-6. Read access timing diagram under async-wait signal assertion

19.4. Register definition

EXMC base address: 0xA000 0000

19.4.1. NOR/PSRAM controller registers

SRAM/NOR Flash control registers (EXMC_SNCTLx) (x=0)

Address offset: 0x00 + 8 * x, (x = 0)
Reset value: 0x0000 30DA for region0.

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ASYNC WAIT	Reserved	NRWTEN	WREN	Reserved		NRWT POL	Reserved		NREN	NRW[1:0]		NRTP[1:0]		NRMUX	NRBKEN
rw		rw	rw			rw			rw	rw		rw		rw	rw

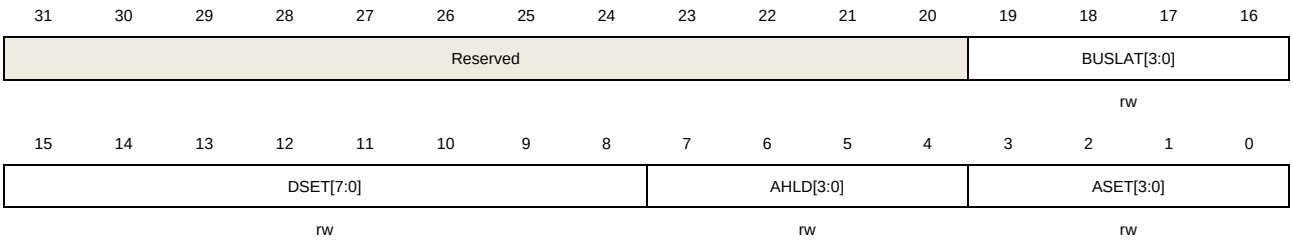
Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value.
15	ASYNCWAIT	Asynchronous wait 0: Disable the asynchronous wait feature 1: Enable the asynchronous wait feature
14	Reserved	Must be kept at reset value.
13	NRWTEN	NWAIT signal enable For Flash memory access in burst mode, this bit enables/disables wait-state insertion via the NWAIT signal: 0: Disable NWAIT signal 1: Enable NWAIT signal
12	WREN	Write enable 0: Disabled write in the bank by the EXMC, otherwise an AHB error is reported 1: Enabled write in the bank by the EXMC (default after reset)
11:10	Reserved	Must be kept at reset value.
9	NRWTPOL	NWAIT signal polarity 0: Low level is active of NWAIT 1: High level is active of NWAIT

8:7	Reserved	Must be kept at reset value.
6	NREN	NOR Flash access enable 0: Disable NOR Flash access 1: Enable NOR Flash access
5:4	NRW[1:0]	NOR region memory data bus width 00: 8 bits 01: 16 bits(default after reset) 10/11: Reserved
3:2	NRTP[1:0]	NOR region memory type 00: SRAM 01: PSRAM（CRAM） 10: NOR Flash(default after reset for region0) 11: Reserved
1	NRMUX	NOR region memory address/data multiplexing 0: Disable address/data multiplexing function 1: Enable address/data multiplexing function
0	NRBKEN	NOR region enable 0: Disable the corresponding memory bank 1: Enable the corresponding memory bank

SRAM/NOR Flash timing configuration registers (EXMC_SNTCFGx) (x=0)

Address offset: 0x04 + 8 * x, (x = 0)
Reset value: 0x0FFF FFFF

This register has to be accessed by word(32-bit)



Bits	Fields	Descriptions
31:24	Reserved	Must be kept at reset value.
19:16	BUSLAT[3:0]	Bus latency The bits are defined in multiplexed read mode in order to avoid bus contention, and represent the data bus to return to a high impedance state's minimum. 0x0: Bus latency = 1 * HCLK period 0x1: Bus latency = 2 * HCLK period

		…… 0xF: Bus latency = 16 * HCLK period
15:8	DSET[7:0]	Data setup time This field is meaningful only in asynchronous access. 0x00: Reserved 0x01: Data setup time = 2 * HCLK period …… 0xFF: Data setup time = 256 * HCLK period
7:4	AHLD[3:0]	Address hold time This field is used to set the time of address hold phase. 0x0: Reserved 0x1: Address hold time = 2 * HCLK …… 0xF: Address hold time = 16 * HCLK
3:0	ASET[3:0]	Address setup time This field is used to set the time of address setup phase. **Note:** meaningful only in asynchronous access of SRAM,ROM,NOR Flash 0x0: Address setup time = 1 * HCLK …… 0xF: Address setup time = 16 * HCLK

20. Controller area network (CAN)

20.1. Overview

CAN bus (for Controller Area Network) is a bus standard designed to allow microcontrollers and devices to communicate with each other without a host computer.

The Basic Extended CAN, interfaces the CAN network. It supports the CAN protocols version 2.0A and B. The CAN interface handles the transmission and the reception of CAN frames fully autonomously. The CAN provides 28 scalable/configurable identifier filter banks. The filters are used for selecting the incoming messages the software needs and discarding the others. Three transmit mailboxes are provided to the software for setting up messages. The transmission scheduler decides which mailbox has to be transmitted first. Three complete messages can be stored in each FIFO. The FIFOs are managed completely by hardware. Two receive FIFOs are used by hardware to store the incoming messages. The CAN controller also provides all hardware functions for supporting the time-triggered communication option for safety-critical applications.

20.2. Characteristics

- Supports CAN protocols version 2.0A, B
- Baud rates up to 1 Mbit/s
- Supports the time-triggered communication
- Interrupt enable and clear

Transmission

- Supports 3 transmit mailboxes
- Prioritization of messages
- Supports Time Stamp at SOF transmission

Reception

- Supports 2 receive FIFOs and each has 3 messages deep
- 28 scalable/configurable identifier filter banks in GD32VF103
- FIFO lock

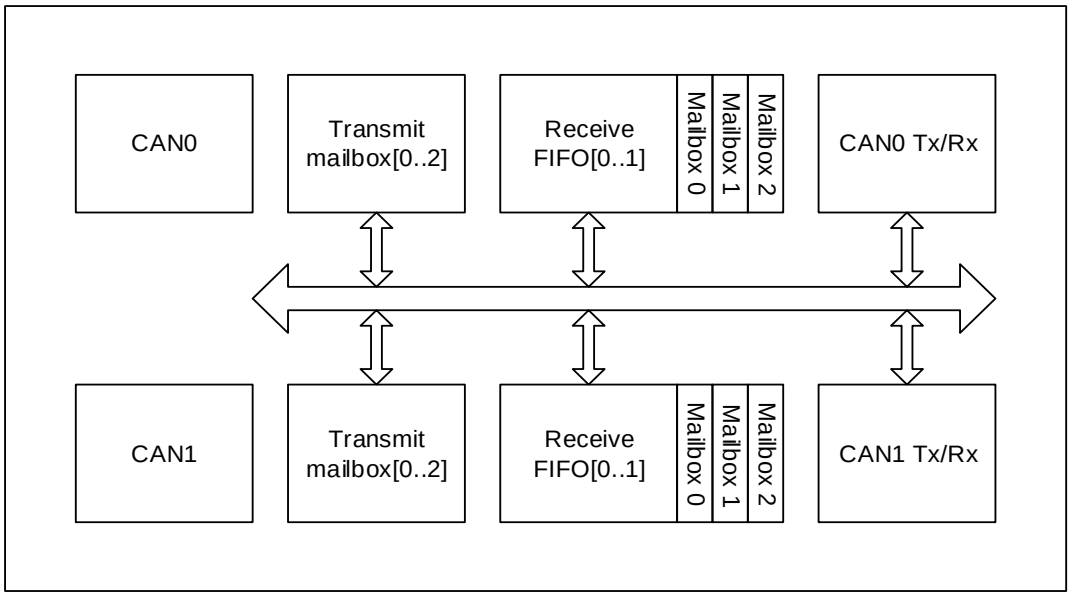
Time-triggered communication

- Disable retransmission automatically
- 16-bit free timer
- Time Stamp on SOF reception
- Time Stamp sent in last two data bytes

20.3. Function overview

Figure 20-1. CAN module block diagram shows the CAN block diagram.

Figure 20-1. CAN module block diagram



20.3.1. Working mode

The CAN interface has three working modes:

- Sleep working mode.
- Initial working mode.
- Normal working mode.

Sleep working mode

Sleep working mode is the default mode after reset. In sleep working mode, the CAN is in the low-power status while the CAN clock is stopped.

When SLPWMOD bit in CAN_CTL register is set, the CAN enters the sleep working mode. Then the SLPWS bit in CAN_STAT register is set.

To leave sleep working mode automatically: the AWU bit in CAN_CTL register is set and the CAN bus activity is detected. To leave sleep working mode by software: clear the SLPWMOD bit in CAN_CTL register.

Sleep working mode to Initial working mode: Set IWMOD bit and clear SLPWMOD bit in CAN_CTL register.

Sleep working mode to Normal working mode: Clear IWMOD and SLPWMOD bit in CAN_CTL register.

Initial working mode

When the options of CAN bus communication is needed to be changed, the CAN must enter initial working mode.

When IWMOD bit in CAN_CTL register is set, the CAN enters the initial working mode. Then the IWS bit in CAN_STAT register is set.

Initial working mode to sleep working mode: Set SLPWMOD bit and clear IWMOD bit in CAN_CTL register.

Initial working mode to Normal working mode: Clear IWMOD bit and clear SLPWMOD bit in CAN_CTL register.

Normal working mode

The CAN can enter normal working mode and to communicate with other CAN communication nodes.

To enter normal working mode: clear IWMOD and SLPWMOD bit in CAN_ CTL register.

Normal working mode to sleep working mode: Set SLPWMOD bit in CAN_CTL register and wait the current transmission or reception completed.

Normal working mode to Initial working mode: Set IWMOD bit in CAN_CTL register, and wait the current transmission or reception completed.

20.3.2. Communication modes

The CAN interface has four communication modes:

- Silent communication mode.
- Loopback communication mode.
- Loopback and silent communication mode.
- Normal communication mode.

Silent communication mode

Silent communication mode means reception available and transmission disable.

The RX pin of the CAN can get the signal from the network and the TX pin always holds logical one.

When the SCMOD bit in CAN_BT register is set, the CAN enters the silent communication mode. When it is cleared, the CAN leaves silent communication mode.

Silent communication mode is useful on monitoring the network messages.

Loopback communication mode

Loopback communication mode means the sending messages are transferred into the reception FIFOs, the RX pin is disconnected from the CAN network and the TX pin can send messages to the CAN network.

Set LCMOD bit in CAN_BT register to enter loopback communication mode or clear it to leave. Loopback communication mode is useful on self-test.

Loopback and silent communication mode

Loopback and silent communication mode means the RX and TX pins are disconnected from the CAN network while the sending messages are transferred into the reception FIFOs.

Set LCMOD and SCMOD bit in CAN_BT register to enter loopback and silent communication mode or clear them to leave.

Loopback and silent communication mode is useful on self-test. The TX pin holds logical one. The RX pin holds high impedance state.

Normal communication mode

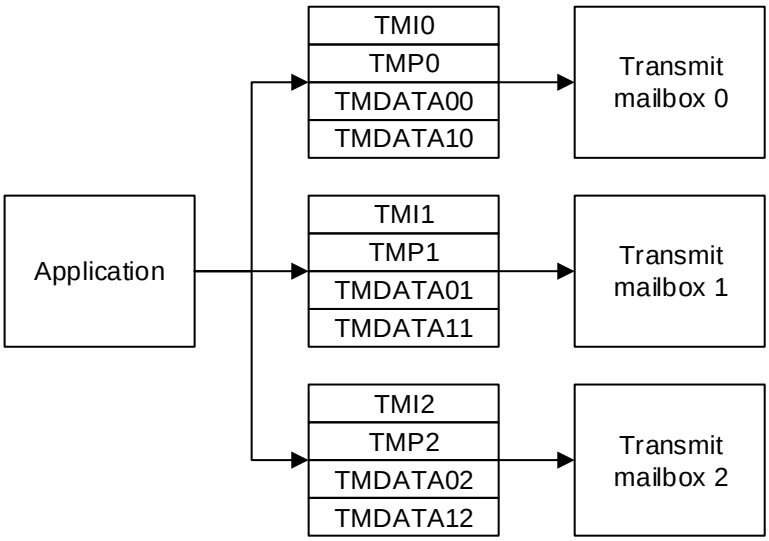
Normal communication mode is the default communication mode unless the LCMOD or SCMOD bit in CAN_BT register is set.

20.3.3. Data transmission

Transmission register

Three transmit mailboxes are transparent to the application. You can use transmit mailboxes through four transmission registers: CAN_TMIx, CAN_TMPx, CAN_TMDATA0x and CAN_TMDATA1x. As shown in ***Figure 20-2. Transmission register***.

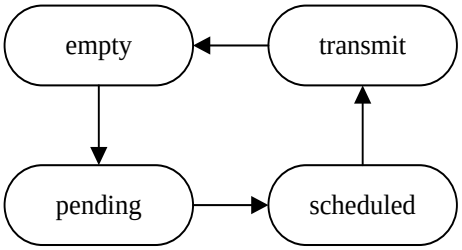
Figure 20-2. Transmission register



Transmit mailbox state

A transmit mailbox can be used when it is free: empty state. If the data is filled in the mailbox, setting TEN bit in CAN_TMIx register to prepare for starting the transmission: pending state. If more than one mailbox is in the pending state, they need schedule the transmission: scheduled state. A mailbox with priority enter transmit state and start transmitting the message. After the message has been sent, the mailbox is free: empty state. As shown in ***Figure 20-3. State of transmission mailbox***.

Figure 20-3. State of transmission mailbox



Transmit status and error

The CAN_TSTAT register includes the transmit status and error bits: MTF, MTFNERR, MAL, MTE.

- MTF: mailbox transmits finished. Typically, MTF is set when the frame in the transmit mailbox has been sent.
- MTFNERR: mailbox transmits finished and no error. MTFNERR is set when the frame in the transmission mailbox has been sent without any error.
- MAL: mailbox arbitration lost. MAL is set while the frame transmission is failed because of the arbitration lost.
- MTE: mailbox transmits error. MTE is set while the frame transmission is failed because of the detection error of CAN bus.

Steps of sending a frame

To send a frame through the CAN:
Step 1: Select one free transmit mailbox.
Step 2: Fill four transmission registers with the application's acquirement.
Step 3: Set TE bit in CAN_TMIx register.
Step 4: Check the transmit status. Typically, MTF and MTFNERR are set if transmission is successful.

Transmission options

Abort

MST bit in CAN_TSTAT register can abort the transmission.

If the transmission mailbox's state is pending or scheduled, the abort of transmission can be done immediately.

In the state of transmit, the abort of transmission does not take effect immediately until the transmission is finished. In case of transmission successful, the MTFNERR and MTF in CAN_TSTAT are set and state changes to empty. In case of transmission failed, the state changes to be scheduled and then the abort of transmission can be done immediately.

Priority

When more than one transmit mailbox is pending, the transmission order is given by the TFO bit in CAN_CTL register.

In case TFO is 1, the three transmit mailboxes work as FIFO.

In case TFO is 0, the transmit mailbox with lowest identifier has the highest priority of transmission. If the identifiers are equal, the lower mailbox number will be scheduled first.

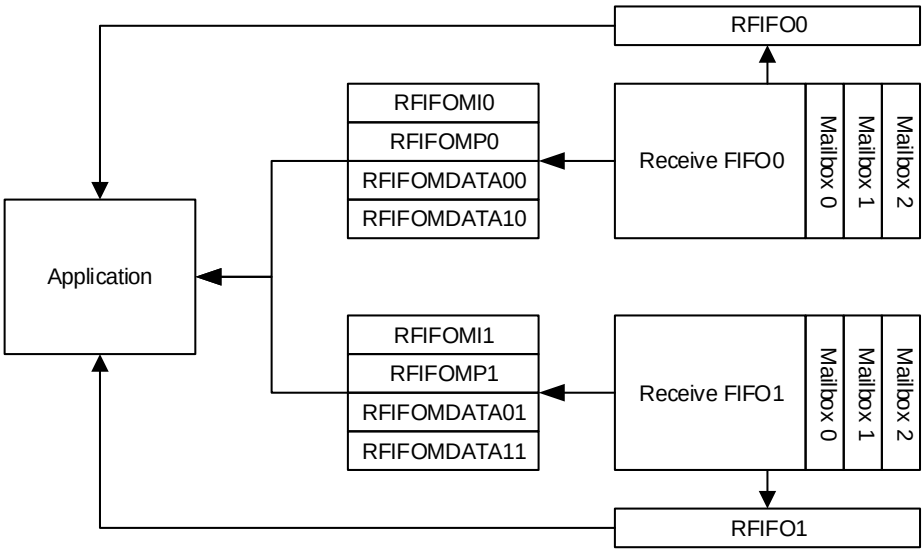
20.3.4. Data reception

Reception register

Two receive FIFOs are transparent to the application. You can use receive FIFOs through five registers: CAN_RFIFOx, CAN_RFIFOMIx, CAN_RFIFOMPx, CAN_RFIFOMDATA0x and CAN_RFIFOMDATA1x. FIFO's status and operation can be handled by CAN_RFIFOx register. Reception frame data can be achieved through the registers: CAN_RFIFOMIx, CAN_RFIFOMPx, CAN_RFIFOMDATA0x and CAN_RFIFOMDATA1x.

Each FIFO consists of three receive mailboxes. As shown in ***Figure 20-4. Reception register***.

Figure 20-4. Reception register



Receive FIFO

Receive FIFO has three mailboxes. The reception frames are stored in the mailbox ordered by the arriving sequence of the frames. First arrived frame can be accessed by application firstly.

The number of frames in the receive FIFO and the status can be accessed by the register CAN_RFIFO0 and CAN_RFIFO1.

If at least one frame has been stored in the receive FIFO0. The frame data is placed in the registers (CAN_RFIFOMI0, CAN_RFIFOMP0, CAN_RFIFOMDATA00, CAN_RFIFOMDATA10). After read the current frame, set RFD bit in CAN_RFIFO0 to release a frame in the receive FIFO and the software can read the next frame.

Receive FIFO status

RFL bit in CAN_RFIFOx register: receive FIFO length. It is 0 when no frame is stored in the reception FIFO and 3 when FIFOx is full.

RFF bit in CAN_RFIFOx register: the FIFO holds three frames. It indicates FIFOx is full.

RFO bit in CAN_RFIFOx register: one new frame arrived while the FIFO has hold three frames. It indicates FIFOx is overfull. If the RFOD bit in CAN_CTL register is set, the new frame is discarded. If the RFOD bit in CAN_CTL register is reset, the new frame is stored into the receive FIFO and the last frame in the receive FIFO is discarded.

Steps of receiving a message

Step 1: Check the number of frames in the receive FIFO.

Step 2: Reading CAN_RFIFOMIx, CAN_RFIFOMPx, CAN_RFIFOMDATA0x and CAN_

RFIFOMDATA1x if there is data pending.

Step 3: Set the RFD bit in CAN_RFIFOx register.

20.3.5. Filtering function

The CAN would receive frames from the CAN bus. If the frame is passed through the filter, it is stored into the receive FIFOs. Otherwise, the frame will be discarded without intervention by the software.

The identifier of frame from the CAN bus takes part in the matching of the filter.

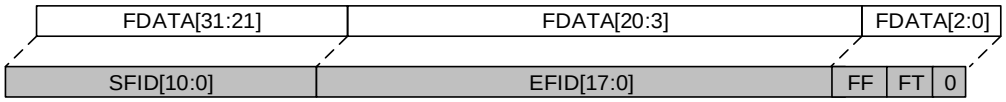
Scale

The filter consists of 28 banks: bank0 to bank27. Each bank has two 32-bit registers: CAN_FxDATA0 and CAN_FxDATA1.

Each filter bank can be configured to 32-bit or 16-bit.

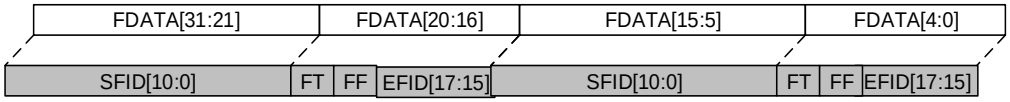
32-bit: SFID[10:0], EFID[17:0], FF and FT bits. As shown in ***Figure 20-5. 32-bit filter***.

Figure 20-5. 32-bit filter



16-bit: SFID [10:0], FT, FF and EFID[17:15] bits. As shown in ***Figure 20-6. 16-bit filter***.

Figure 20-6. 16-bit filter



Mask mode

For the Identifier of a data frame to be filtered, the mask mode is used to specify which bits must be the same as the preset Identifier and which bits need not be judged. 32-bit mask mode example is shown in ***Figure 20-7. 32-bit mask mode filter***.

Figure 20-7. 32-bit mask mode filter

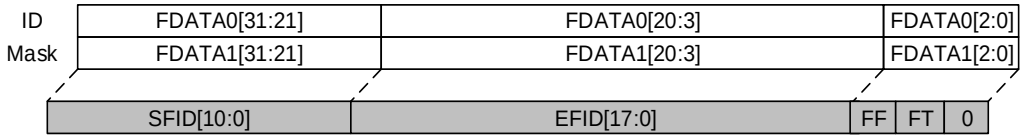


Figure 20-8. 16-bit mask mode filter

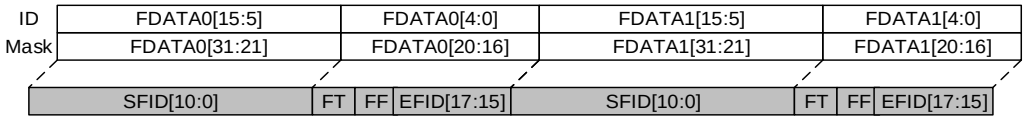

List mode

The filter consists of frame identifiers. The filter can decide whether a frame will be discarded or not. When one frame arrived, the filter will check which member can match the identifier of the frame.

32-bit list mode example is shown in ***Figure 20-9. 32-bit list mode filter***.

Figure 20-9. 32-bit list mode filter

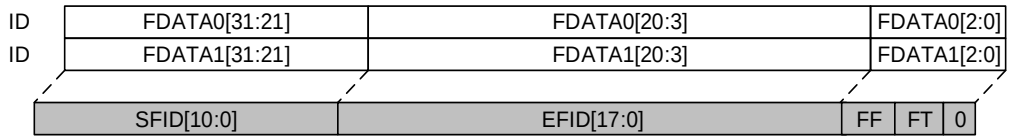

Figure 20-10. 16-bit list mode filter

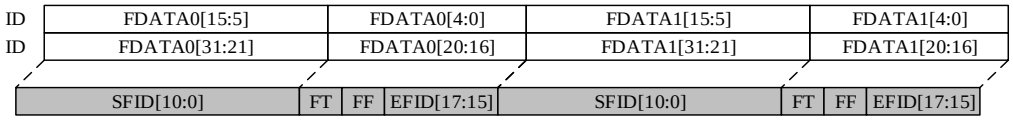


Filter number

Each filter within a filter bank is numbered from 0 to a maximum dependent on the mode and the scale of each of the filter banks.

For example, there are two filter banks. Bank 0 is configured as 32-bit mask mode. Bank 1 is configured as 32-bit list mode. The filter number is shown in ***Table 20-1. 32-bit filter number***.

Table 20-1. 32-bit filter number

Filter Bank	Filter Data Register	Filter Number
0	F0DATA0-32bit-ID	0
	F0DATA1-32bit-Mask	
1	F1DATA0-32bit-ID	1
	F1DATA1-32bit-ID	2

Associated FIFO

28 banks can be associated with FIFO0 or FIFO1. If the bank is associated with FIFO0, the frames passed through the bank will fill the FIFO0.

Active

The filter bank needs to be configured activation if the application wants the bank working and while filters not used by the application should be left deactivated.

Filtering index

Each filter number corresponds to a filtering rule. When the frame from the CAN bus passes

the filters, a filter number must associate with the frame. The filter number is called filtering index. It stores in the FI bits in CAN_RFIFOMPx when the frame is read by the application.

Each FIFO numbers the filters within the banks associated with the FIFO itself whether the bank is active or not.

The example about filtering index is shown in ***Table 20-2. Filtering index***.

Table 20-2. Filtering index

Filter Bank	FIFO0	Active	Filter Nunber	Filter Bank	FIFO1	Active	Filter Nunber
0	F0DATA0-32bit-ID	Yes	0	2	F2DATA0[15:0]-16bit-ID	Yes	0
	F0DATA1-32bit-Mask				F2DATA0[31:16]-16bit-Mask		
1	F1DATA0-32bit-ID	Yes	1		F2DATA1[15:0]-16bit-ID		1
	F1DATA1-32bit-ID		2		F2DATA1[31:16]-16bit-Mask		
3	F3DATA0[15:0]-16bit-ID	No	3	4	F4DATA0-32bit-ID	No	2
	F3DATA0[31:16]-16bit-Mask				F4DATA1-32bit-Mask		
	F3DATA1[15:0]-16bit-ID		4	5	F5DATA0-32bit-ID	No	3
	F3DATA1[31:16]-16bit-Mask				F5DATA1-32bit-ID		4
7	F7DATA0[15:0]-16bit-ID	No	5	6	F6DATA0[15:0]-16bit-ID	Yes	5
	F7DATA0[31:16]-16bit-ID		6		F6DATA0[31:16]-16bit-ID		6
	F7DATA1[15:0]-16bit-ID		7		F6DATA1[15:0]-16bit-ID		7
	F7DATA1[31:16]-16bit-ID		8		F6DATA1[31:16]-16bit-ID		8
8	F8DATA0[15:0]-16bit-ID	Yes	9	10	F10DATA0[15:0]-16bit-ID	No	9
	F8DATA0[31:16]-16bit-ID		10		F10DATA0[31:16]-16bit-Mask		
	F8DATA1[15:0]-16bit-ID		11		F10DATA1[15:0]-16bit-ID		10
	F8DATA1[31:16]-16bit-ID		12		F10DATA1[31:16]-16bit-Mask		
9	F9DATA0[15:0]-16bit-ID	Yes	13	11	F11DATA0[15:0]-16bit-ID	No	11
	F9DATA0[31:16]-16bit-Mask				F11DATA0[31:16]-16bit-ID		12
	F9DATA1[15:0]-16bit-ID		14		F11DATA1[15:0]-16bit-ID		13
	F9DATA1[31:16]-16bit-Mask				F11DATA1[31:16]-16bit-ID		14
12	F12DATA0-32bit-ID	Yes	15	13	F13DATA0-32bit-ID	Yes	15
	F12DATA1-32bit-Mask				F13DATA1-32bit-ID		16

Priority

The filters have the priority:

1. 32-bit mode is higher than 16-bit mode.
2. List mode is higher than mask mode.
3. Smaller filter index value has the higher priority.

20.3.6. Time-triggered communication

The time-triggered CAN protocol is a higher layer protocol on top of the CAN data link layer. Time-triggered communication means that activities are triggered by the elapsing of time segments. In a time-triggered communication system all points of time of message transmission are defined during the development of a system. A time-triggered communication system is ideal for applications in which the data traffic is of a periodic nature.

In this mode, an internal 16-bit counter starts working, incrementing by 1 at each CAN bit time. This internal counter provides time stamps for sending and receiving data, stored in registers CAN _RFIFOMPx and CAN_TMPx.

The automatic retransmission is disabled in the time-triggered CAN communication.

20.3.7. Communication parameters

Nonautomatic retransmission mode

In time-triggered communication mode, the requirement for automatic retransmission must be disabled and can be met by setting ARD position 1 of the CAN_CTL register.

In this mode, the data is sent only once, and if the transmission fails due to arbitration failure or bus error, the CAN bus controller does not automatically resend the data as usual.

At the end of sending, the MTF bit of register CAN_TSTAT is hardware set to 1, and the sending status information can be obtained via MTFNERR, MAL, and MTE.

Bit time

On the bit-level the CAN protocol uses synchronous bit transmission. This not only enhances the transmitting capacity but also means that a sophisticated method of bit synchronization is required. While bit synchronization in a character-oriented transmission (asynchronous) is performed upon the reception of the start bit available with each character, a synchronous transmission protocol there is just one start bit available at the beginning of a frame. To ensure the receiver to correctly read the messages, continuous resynchronization is required. Phase buffer segments are therefore inserted before and after the nominal sample point within a bit interval.

The CAN protocol regulates bus access by bit-wise arbitration. The signal propagation from sender to receiver and back to the sender must be completed within one bit-time. For synchronization purposes a further time segment, the propagation delay segment, is needed in addition to the time reserved for synchronization, the phase buffer segments. The propagation delay segment takes into account the signal propagation on the bus as well as signal delays caused by transmitting and receiving nodes.

The normal bit time simplified by the CAN from the CAN protocol has three segments as follows:

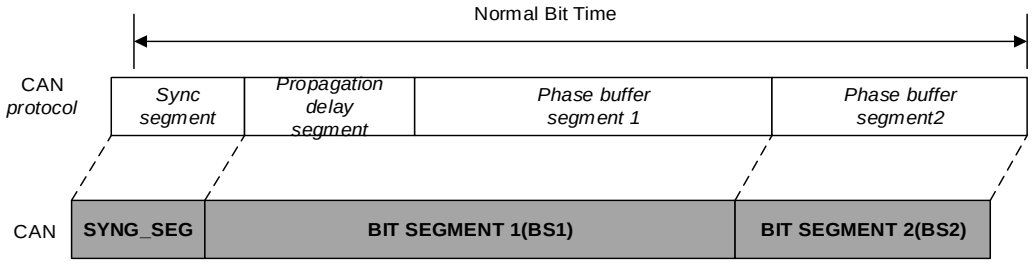
Synchronization segment (SYNC_SEG): a bit change is expected to occur within this time segment. It has a fixed length of one time quantum ($1 \times t_q$).

Bit segment 1 (BS1): defines the location of the sample point. It includes the *Propagation delay segment* and *Phase buffer segment 1* of the CAN standard. Its duration is programmable between 1 and 16 time quanta but may be automatically lengthened to compensate for positive phase drifts due to differences in the frequency of the various nodes of the network.

Bit segment 2 (BS2): defines the location of the transmit point. It represents the *Phase buffer segment 2* of the CAN standard. Its duration is programmable between 1 and 8 time quanta but may also be automatically shortened to compensate for negative phase drifts.

The bit time is shown as in the ***Figure 20-11. The bit time***.

Figure 20-11. The bit time



The resynchronization Jump Width (SJW) defines an upper bound to the amount of lengthening or shortening of the bit segments. It is programmable between 1 and 4 time quanta.

A valid edge is defined as the first transition in a bit time from dominant to recessive bus level provided the controller itself does not send a recessive bit.

If a valid edge is detected in BS1 instead of SYNC_SEG, BS1 is extended by up to SJW so that the sample point is delayed.

Conversely, if a valid edge is detected in BS2 instead of SYNC_SEG, BS2 is shortened by up to SJW so that the transmit point is moved earlier.

Baud rate

The CAN's clock derives from the APB1 bus. The CAN calculates its baud rate as follow:

$$BaudRate = \frac{1}{Normal\ Bit\ Time} \tag{21-1}$$

$$Normal\ Bit\ Time = t_{SYNC\_SEG} + t_{BS1} + t_{BS2} \tag{21-2}$$

with:

$$t_{SYNC\_SEG} = 1 \times t_q \tag{21-3}$$

$$t_{BS1} = (1 + BT.BS1) \times t_q \quad (21\text{-}4)$$

$$t_{BS2} = (1 + BT.BS2) \times t_q \quad (21\text{-}5)$$

$$t_q = (1 + BT.BAUDPSC) \times t_{PCLK1} \quad (21\text{-}6)$$

20.3.8. Error flags

The state of can bus can be reflected by Transmit Error Counter (TECNT) and Receive Error Counter (RECNT) of CAN_ERR register. The value CAN be increased or decreased by the hardware according to the error, and the software can judge the stability of the CAN network by these values. For details on incorrect counting, refer to the CAN protocol section.

By using the CAN_INTEN register (ERRIE bit, etc.), the software can control the interrupt generation when error is detected.

Bus-Off recovery

The CAN controller is in Bus-Off state when TECNT is over than 255. In This state, BOERR bit is set in CAN_ERR register, and no longer able to transmit and receive messages.

According to the ABOR configuration in register CAN_CTL, there are two ways to recover from Bus-Off (to an error active state). Both of these methods require the CAN bus controller in the Bus-Off state to detect the Bus-Off recovery sequence defined by CAN protocol (when CAN_RX detects 128 consecutive 11-bit recessive bits) before automatic recovery.

If ABOR is set, it will be automatically recovered when a Bus-Off recovery sequence is detected.

If ABOR is cleared, CAN controller must be configured to enter initialization mode by setting IWMOD bit in CAN_CTL register, then exit and enter nomal mode. After this operation, it will recover when the recovering sequence is detected.

20.3.9. CAN interrupts

The CAN bus controller occupies 4 interrupt vectors, which are controlled by the register CAN _INTEN.

The interrupt sources can be classified into:

- transmit interrupt
- FIFO0 interrupt
- FIFO1 interrupt
- error and status change interrupt

Transmit interrupt

The transmit interrupt can be generated by any of the following conditions and TMEIE bit in CAN_INTEN register will be set:

- TX mailbox 0 transmit finished: MTF0 bit in the CAN_TSTAT register is set.
- TX mailbox 1 transmit finished: MTF1 bit in the CAN_TSTAT register is set.
- TX mailbox 2 transmit finished: MTF2 bit in the CAN_TSTAT register is set.

Receive FIFO0 interrupt

The Receive FIFO0 interrupt can be generated by the following conditions:

- Reception FIFO0 not empty: RFL0 bits in the CAN_RFIFO0 register are not '00' and RFNEIE0 in CAN_INTEN register is set.
- Reception FIFO0 full: RFF0 bit in the CAN_RFIFO0 register is set and RFFIE0 in CAN_INTEN register is set.
- Reception FIFO0 overrun: RFO0 bit in the CAN_RFIFO0 register is set and RFOIE0 in CAN_INTEN register is set.

Receive FIFO1 interrupt

The Receive FIFO1 interrupt can be generated by the following conditions:

- Reception FIFO1 not empty: RFL1 bits in the CAN_RFIFO1 register are not '00' and RFNEIE1 in CAN_INTEN register is set.
- Reception FIFO1 full: RFF1 bit in the CAN_RFIFO1 register is set and RFFIE1 in CAN_INTEN register is set.
- Reception FIFO1 overrun: RFO1 bit in the CAN_RFIFO1 register is set and RFOIE1 in CAN_INTEN register is set.

Error and working mode change interrupt

The error and working mode change interrupt can be generated by the following conditions:

- Error: ERRIF bit in the CAN_STAT register and ERRIE bit in the CAN_INTEN register are set. Refer to ERRIF description in the CAN_STAT register.
- Wakeup: WUIF bit in the CAN_STAT register is set and WIE bit in the CAN_INTEN register is set.
- Enter sleep working mode: SLPIF bit in the CAN_STAT register is set and SLPWIE bit in the CAN_INTEN register is set.

20.4. Register definition

CAN0 base address: 0x4000 6400

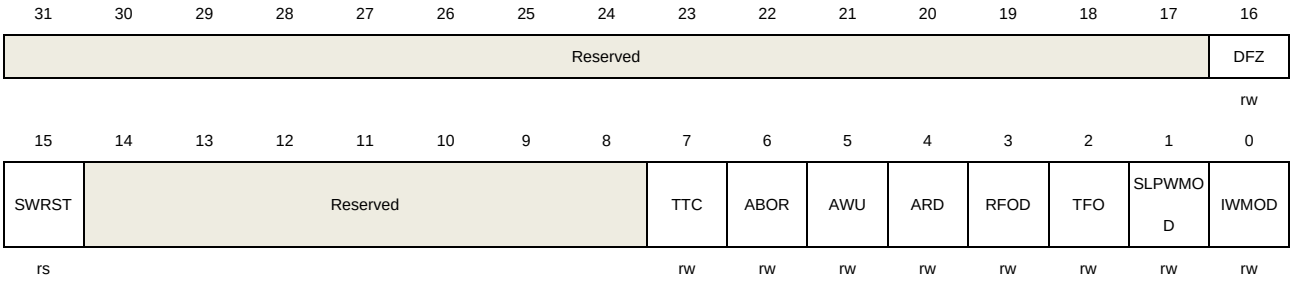
CAN1 base address: 0x4000 6800

20.4.1. Control register (CAN_CTL)

Address offset: 0x00

Reset value: 0x0001 0002

This register has to be accessed by word(32-bit)



Bits	Fields	Descriptions
31:17	Reserved	Must be kept at reset value
16	DFZ	Debug freeze If the CANx_HOLD in DBG_CTL register is set, this bit define the CAN stop for debug or work normal. If the CANx_HOLD in DBG_CTL register is clear, this bit take not effect. 0: CAN reception and transmission working normal even during debug 1: CAN reception and transmission stop working during debug
15	SWRST	Software reset 0: No effect 1: Reset CAN with working mode of sleep. This bit is automatically reset to 0
14:8	Reserved	Must be kept at reset value
7	TTC	Time-triggered communication 0: Disable time-triggered communication 1: Enable time-triggered communication
6	ABOR	Automatic bus-off recovery 0: The bus-off state is left manually by software 1: The bus-off state is left automatically by hardware
5	AWU	Automatic wakeup If this bit is set, the sleep mode left when CAN bus activity detected, and

		SLPWMOD bit in CAN_CTL register will be cleared automatically. 0: The sleeping working mode is left manually by software 1: The sleeping working mode is left automatically by hardware
4	ARD	Automatic retransmission disable 0: Enable Automatic retransmission 1: Disable Automatic retransmission
3	RFOD	Receive FIFO overwrite disable 0: Enable receive FIFO overwrite when receive FIFO is full and overwrite the FIFO with the incoming frame 1: Disable receive FIFO overwrite when receive FIFO is full and discard the incoming frame
2	TFO	Transmit FIFO order 0: Order with the identifier of the frame 1: Order with first in and first out
1	SLPWMOD	Sleep working mode If this bit is set by software, the CAN enter sleep working mode after current transmission or reception complete. This bit can cleared by software or hardware. If AWU bit in CAN_CTL register is set, this bit is cleared by hardware when CAN bus activity detected. 0: Disable sleep working mode 1: Enable sleep working mode
0	IWMOD	Initial working mode 0: Disable initial working mode 1: Enable initial working mode

20.4.2. Status register (CAN_STAT)

Address offset: 0x04

Reset value: 0x0000 0C02

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved				RXL	LASTRX	RS	TS	Reserved			SLPIF	WUIF	ERRIF	SLPWS	IWS
				r	r	r	r				rc_w1	rc_w1	rc_w1	r	r

Bits	Fields	Descriptions

31:12	Reserved	Must be kept at reset value
11	RXL	RX level
10	LASTRX	Last sample value of RX pin
9	RS	Receiving state 0: CAN is not working in the receiving state 1: CAN is working in the receiving state
8	TS	Transmitting state 0: CAN is not working in the transmitting state 1: CAN is working in the transmitting state
7:5	Reserved	Must be kept at reset value
4	SLPIF	Status change interrupt flag of sleep working mode entering This bit is set by hardware when entering sleep working mode, and cleared by hardware when the CAN not in sleep working mode. This bit can also cleared by software when write 1 to this bit. 0: CAN is not entering the sleep working mode 1: CAN is entering the sleep working mode.
3	WUIF	Status change interrupt flag of wakeup from sleep working mode This bit is set when CAN bus activity detected on sleep working mode. This bit can cleared by software when write 1 to this bit. 0: Wakeup event is not coming 1: Wakeup event is coming
2	ERRIF	Error interrupt flag This bit is set by following event. The BOERR bit in CAN_ERR register is set and BOIE bit in CAN_INTEN register is set. Or the PERR bit in CAN_ERR register is set and PERRIE bit in CAN_INTEN register is set. Or the WERR bit in CAN_ERR register is set and WERRIE bit in CAN_INTEN register is set. Or the ERRN bits in CAN_ERR register are set to 1 to 6 (not 0 and not 7) and ERRNIE in CAN_INTEN register is set. This bit is cleared by software when write 1 to this bit. 0: No error interrupt flag 1: Any error interrupt flag has happened
1	SLPWS	Sleep working state This bit is set by hardware when the CAN enter sleep working mode after set SLPWMOD bit in CAN_CTL register. If the CAN leave from normal working mode to sleep working mode, it must wait the current frame transmission or reception completed. This bit is cleared by hardware when the CAN leave sleep working mode. Clear SLPWMOD bit in CAN_CTL register or automatically detect the CAN bus activity when AWU bit is set in CAN_CTL register. If leave sleep working mode to normal working mode, this bit will be cleared after receive 11 consecutive recessive bits from the CAN bus.

0: CAN is not the state of sleep working mode
1: CAN is the state of sleep working mode

0	IWS	Initial working state This bit is set by hardware when the CAN enter initial working mode after set IWMOD bit in CAN_CTL register. If the CAN leave from normal working mode to initial working mode, it must wait the current frame transmission or reception completed. This bit is cleared by hardware when the CAN leave initial working mode after clear IWMOD bit in CAN_CTL register. If leave initial working mode to normal working mode, this bit will be cleared after receive 11 consecutive recessive bits from the CAN bus. 0: CAN is not the state of initial working mode 1: CAN is the state of initial working mode

20.4.3. Transmit status register (CAN_TSTAT)

Address offset: 0x08
Reset value: 0x1C00 0000

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TMLS2	TMLS1	TMLS0	TME2	TME1	TME0	NUM[1:0]		MST2	Reserved			MTE2	MAL2	MTFNERR2	MTF2
r	r	r	r	r	r	r		rs				rc_w1	rc_w1	rc_w1	rc_w1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MST1	Reserved			MTE1	MAL1	MTFNERR1	MTF1	MST0	Reserved			MTE0	MAL0	MTFNERR0	MTF0
rs				rc_w1	rc_w1	rc_w1	rc_w1	rs				rc_w1	rc_w1	rc_w1	rc_w1

Bits	Fields	Descriptions
31	TMLS2	Transmit mailbox 2 last sending in transmit FIFO This bit is set by hardware when transmit mailbox 2 has the last sending order in the transmit FIFO with at least two frame are pending.
30	TMLS1	Transmit mailbox 1 last sending in transmit FIFO This bit is set by hardware when transmit mailbox 1 has the last sending order in the transmit FIFO with at least two frame are pending.
29	TMLS0	Transmit mailbox 0 last sending in transmit FIFO This bit is set by hardware when transmit mailbox 0 has the last sending order in the transmit FIFO with at least two frame are pending.
28	TME2	Transmit mailbox 2 empty 0: Transmit mailbox 2 not empty

		1: Transmit mailbox 2 empty
27	TME1	Transmit mailbox 1 empty 0: Transmit mailbox 1 not empty 1: Transmit mailbox 1 empty
26	TME0	Transmit mailbox 0 empty 0: Transmit mailbox 0 not empty 1: Transmit mailbox 0 empty
25:24	NUM[1:0]	These bits are the number of the transmit FIFO mailbox in which the frame will be transmitted if at least one mailbox is empty. These bits are the number of the transmit FIFO mailbox in which the frame will be transmitted lastly if all mailboxes are full.
23	MST2	Mailbox 2 stop transmitting This bit is set by the software to stop mailbox 2 transmitting. This bit is reset by the hardware while the mailbox 2 is empty.
22:20	Reserved	Must be kept at reset value
19	MTE2	Mailbox 2 transmit error This bit is set by hardware while the transmit error is occurred. This bit reset by software when write 1 to this bit or MTF2 bit in CAN_TSTAT register. This bit reset by hardware when next transmit start.
18	MAL2	Mailbox 2 arbitration lost This bit is set while the arbitration lost is occurred. This bit reset by software when write 1 to this bit or MTF2 bit in CAN_TSTAT register. This bit reset by hardware when next transmit start.
17	MTFNERR2	Mailbox 2 transmit finished and no error This bit is set when the transmission finished and no error. This bit reset by software when write 1 to this bit or MTF2 bit in CAN_TSTAT register. This bit reset by hardware when the transmission finished with error. 0: Mailbox 2 transmit finished with error 1: Mailbox 2 transmit finished and no error
16	MTF2	Mailbox 2 transmit finished This bit set by hardware when the transmission finish or abort. This bit reset by software when write 1 to this bit or TEN bit in CAN_TMI2 is 1. 0: Mailbox 2 transmit is progressing 1: Mailbox 2 transmit finished
15	MST1	Mailbox 1 stop transmitting This bit is set by the software to stop mailbox 1 transmitting. This bit is reset by the hardware while the mailbox 1 is empty.

14:12	Reserved	Must be kept at reset value
11	MTE1	Mailbox 1 transmit error This bit is set by hardware while the transmit error is occurred. This bit reset by software when write 1 to this bit or MTF1 bit in CAN_TSTAT register. This bit reset by hardware when next transmit start.
10	MAL1	Mailbox 1 arbitration lost This bit is set while the arbitration lost is occurred. This bit reset by software when write 1 to this bit or MTF1 bit in CAN_TSTAT register. This bit reset by hardware when next transmit start.
9	MTFNERR1	Mailbox 1 transmit finished and no error This bit is set when the transmission finished and no error. This bit reset by software when write 1 to this bit or MTF1 bit in CAN_TSTAT register. This bit reset by hardware when the transmission finished with error. 0: Mailbox 1 transmit finished with error 1: Mailbox 1 transmit finished and no error
8	MTF1	Mailbox 1 transmit finished This bit is set by hardware when the transmission finish or abort. This bit reset by software when write 1 to this bit or TEN bit in CAN_TMI1 is 1. 0: Mailbox 1 transmit is progressing 1: Mailbox 1 transmit finished
7	MST0	Mailbox 0 stop transmitting This bit is set by the software to stop mailbox 0 transmitting. This bit is reset by the hardware while the mailbox 0 is empty.
6:4	Reserved	Must be kept at reset value
3	MTE0	Mailbox 0 transmit error This bit is set by hardware while the transmit error is occurred. This bit reset by software when write 1 to this bit or MTF0 bit in CAN_TSTAT register. This bit reset by hardware when next transmit start.
2	MAL0	Mailbox 0 arbitration lost This bit is set while the arbitration lost is occurred. This bit reset by software when write 1 to this bit or MTF0 bit in CAN_TSTAT register. This bit reset by hardware when next transmit start.
1	MTFNERR0	Mailbox 0 transmit finished and no error This bit is set when the transmission finished and no error. This bit reset by software when write 1 to this bit or MTF0 bit in CAN_TSTAT register. This bit reset by hardware when the transmission finished with error. 0: Mailbox 0 transmit finished with error 1: Mailbox 0 transmit finished and no error

0	MTF0	Mailbox 0 transmit finished This bit is set by hardware when the transmission finish or abort. This bit reset by software when write 1 to this bit or TEN bit in CAN_TMI0 is 1. 0: Mailbox 0 transmit is progressing 1: Mailbox 0 transmit finished

20.4.4. Receive message FIFO0 register (CAN_RFIFO0)

Address offset: 0x0C

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved										RFD0	RFO0	RFF0	Reserved	RFL0[1:0]	
										rs	rc_w1	rc_w1		r	

Bits	Fields	Descriptions
31:6	Reserved	Must be kept at reset value
5	RFD0	Receive FIFO0 dequeue This bit is set by the software to start dequeuing a frame from receive FIFO0. This bit is reset by the hardware while the dequeuing is done.
4	RFO0	Receive FIFO0 overfull This bit is set by hardware when receive FIFO0 is overfull and reset by software when write 1 to this bit. 0: The receive FIFO0 is not overfull 1: The receive FIFO0 is overfull
3	RFF0	Receive FIFO0 full This bit is set by hardware when receive FIFO0 is full and reset by software when write 1 to this bit. 0: The receive FIFO0 is not full 1: The receive FIFO0 is full
2	Reserved	Must be kept at reset value
1:0	RFL0[1:0]	Receive FIFO0 length These bits are the length of the receive FIFO0.

20.4.5. Receive message FIFO1 register (CAN_RFIFO1)

Address offset: 0x10

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Reserved															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

										rs	rc_w1	rc_w1		r	

Bits	Fields	Descriptions
31:6	Reserved	Must be kept at reset value
5	RFD1	Receive FIFO1 dequeue This bit is set by the software to start dequeuing a frame from receive FIFO1. This bit is reset by the hardware while the dequeuing is done.
4	RFO1	Receive FIFO1 overfull This bit is set by hardware when receive FIFO1 is overfull and reset by software when write 1 to this bit. 0: The receive FIFO1 is not overfull 1: The receive FIFO1 is overfull
3	RFF1	Receive FIFO1 full This bit is set by hardware when receive FIFO1 is full and reset by software when write 1 to this bit. 0: The receive FIFO1 is not full 1: The receive FIFO1 is full
2	Reserved	Must be kept at reset value
1:0	RFL1[1:0]	Receive FIFO1 length These bits are the length of the receive FIFO1.

20.4.6. Interrupt enable register (CAN_INTEN)

Address offset: 0x14

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reserved														SLPWIE	WIE
														rw	rw

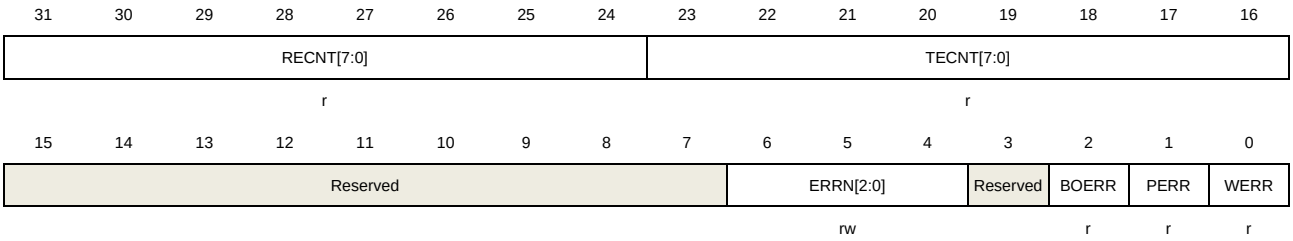
Bits	Fields	Descriptions
31:18	Reserved	Must be kept at reset value
17	SLPWIE	Sleep working interrupt enable 0: Sleep working interrupt disable 1: Sleep working interrupt enable
16	WIE	Wakeup interrupt enable 0: Wakeup interrupt disable 1: Wakeup interrupt enable
15	ERRIE	Error interrupt enable 0: Error interrupt disable 1: Error interrupt enable
14:12	Reserved	Must be kept at reset value
11	ERRNIE	Error number interrupt enable 0: Error number interrupt disable 1: Error number interrupt enable
10	BOIE	Bus-off interrupt enable 0: Bus-off interrupt disable 1: Bus-off interrupt enable
9	PERRIE	Passive error interrupt enable 0: Passive error interrupt disable 1: Passive error interrupt enable
8	WERRIE	Warning error interrupt enable 0: Warning error interrupt disable 1: Warning error interrupt enable
7	Reserved	Must be kept at reset value
6	RFOIE1	Receive FIFO1 overfull interrupt enable 0: Receive FIFO1 overfull interrupt disable 1: Receive FIFO1 overfull interrupt enable
5	RFFIE1	Receive FIFO1 full interrupt enable 0: Receive FIFO1 full interrupt disable 1: Receive FIFO1 full interrupt enable

4	RFNEIE1	Receive FIFO1 not empty interrupt enable 0: Receive FIFO1 not empty interrupt disable 1: Receive FIFO1 not empty interrupt enable
3	RFOIE0	Receive FIFO0 overfull interrupt enable 0: Receive FIFO0 overfull interrupt disable 1: Receive FIFO0 overfull interrupt enable
2	RFFIE0	Receive FIFO0 full interrupt enable 0: Receive FIFO0 full interrupt disable 1: Receive FIFO0 full interrupt enable
1	RFNEIE0	Receive FIFO0 not empty interrupt enable 0: Receive FIFO0 not empty interrupt disable 1: Receive FIFO0 not empty interrupt enable
0	TMEIE	Transmit mailbox empty interrupt enable 0: Transmit mailbox empty interrupt disable 1: Transmit mailbox empty interrupt enable

20.4.7. Error register (CAN_ERR)

Address offset: 0x18
Reset value: 0x0000 0000

This register has to be accessed by word(32-bit)



Bits	Fields	Descriptions
31:24	RECNT[7:0]	Receive Error Count defined by the CAN standard
23:16	TECNT[7:0]	Transmit Error Count defined by the CAN standard
15:7	Reserved	Must be kept at reset value
6:4	ERRN[2:0]	Error number These bits indicate the error status of bit transformation. They are updated by the hardware. While the bit transformation is successful, they are equal to 0. Software can set these bits to 0b111. 000: No Error 001: Stuff Error

		010: Form Error 011: Acknowledgment Error 100: Bit recessive Error 101: Bit dominant Error 110: CRC Error 111: Set by software
3	Reserved	Must be kept at reset value
2	BOERR	Bus-off error Whenever the CAN enters bus-off state, the bit will be set by the hardware. The bus-off state is entered on TECNT overflow, greater than 255.
1	PERR	Passive error Whenever the TECNT or RECNT is greater than 127, the bit will be set by the hardware.
0	WERR	Warning error Whenever the TECNT or RECNT is greater than or equal to 96, the bit will be set by the hardware.

20.4.8. Bit timing register (CAN_BT)

Address offset: 0x1C

Reset value: 0x0123 0000

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SCMOD	LCMOD	Reserved				SJW[1:0]		Reserved	BS2[2:0]			BS1[3:0]

Bits	Fields	Descriptions
31	SCMOD	Silent communication mode 0: Silent communication disable 1: Silent communication enable
30	LCMOD	Loopback communication mode 0: Loopback communication disable 1: Loopback communication enable
29:26	Reserved	Must be kept at reset value
25:24	SJW[1:0]	Resynchronization jump width

		Resynchronization jump width time quantum= SJW[1:0]+1
23	Reserved	Must be kept at reset value
22:20	BS2[2:0]	Bit segment 2 Bit segment 2 time quantum=BS2[2:0]+1
19:16	BS1[3:0]	Bit segment 1 Bit segment 1 time quantum=BS1[3:0]+1
15:10	Reserved	Must be kept at reset value
9:0	BAUDPSC[9:0]	Baud rate prescaler The CAN baud rate prescaler

20.4.9. Transmit mailbox identifier register (CAN_TMIx) (x=0..2)

Address offset: 0x180, 0x190, 0x1A0

Reset value: 0xXXXX XXXX (bit0=0)

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SFID[10:0]/EFID[28:18]											EFID[17:13]				
rw											rw				

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EFID[12:0]													FF	FT	TEN
rw													rw	rw	rw

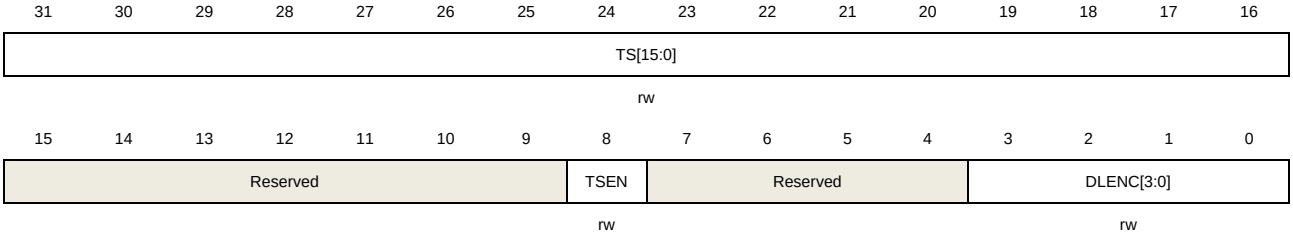
Bits	Fields	Descriptions
31:21	SFID[10:0]/EFID[28:18]	The frame identifier SFID[10:0]: Standard format frame identifier EFID[28:18]: Extended format frame identifier
20:16	EFID[17:13]	The frame identifier EFID[17:13]: Extended format frame identifier
15:3	EFID[12:0]	The frame identifier EFID[12:0]: Extended format frame identifier
2	FF	Frame format 0: Standard format frame 1: Extended format frame
1	FT	Frame type 0: Data frame 1: Remote frame

0	TEN	Transmit enable This bit is set by the software when one frame will be transmitted and reset by the hardware when the transmit mailbox is empty. 0: Transmit disable 1: Transmit enable

20.4.10. Transmit mailbox property register (CAN_TMPx) (x=0..2)

Address offset: 0x184, 0x194, 0x1A4
Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)



Bits	Fields	Descriptions
31:16	TS[15:0]	Time stamp The time stamp of frame in transmit mailbox.
15:9	Reserved	Must be kept at reset value
8	TSEN	Time stamp enable 0: Time stamp disable 1: Time stamp enable. The TS[15:0] will be transmitted in the DB6 and DB7 in DL This bit is available while the TTC bit in CAN_CTL is set.
7:4	Reserved	Must be kept at reset value
3:0	DLENC[3:0]	Data length code DLENC[3:0] is the number of bytes in a frame.

20.4.11. Transmit mailbox data0 register (CAN_TMDATA0x) (x=0..2)

Address offset: 0x188, 0x198, 0x1A8
Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)

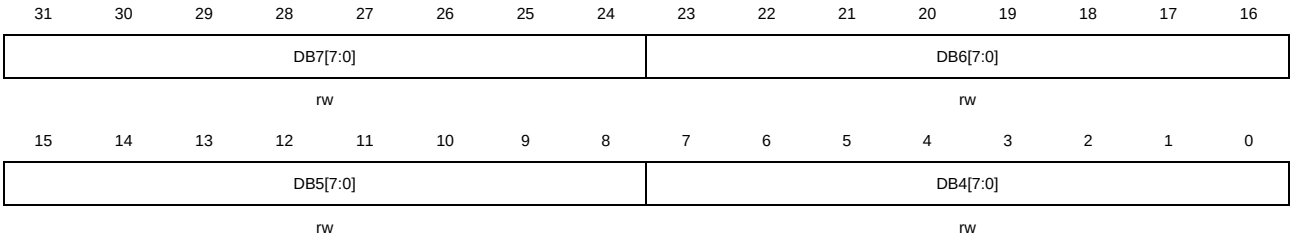
				rw								rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DB1[7:0]								DB0[7:0]							
				rw								rw			

Bits	Fields	Descriptions
31:24	DB3[7:0]	Data byte 3
23:16	DB2[7:0]	Data byte 2
15:8	DB1[7:0]	Data byte 1
7:0	DB0[7:0]	Data byte 0

20.4.12. Transmit mailbox data1 register (CAN_TMDATA1x) (x=0..2)

Address offset: 0x18C, 0x19C, 0x1AC
Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)

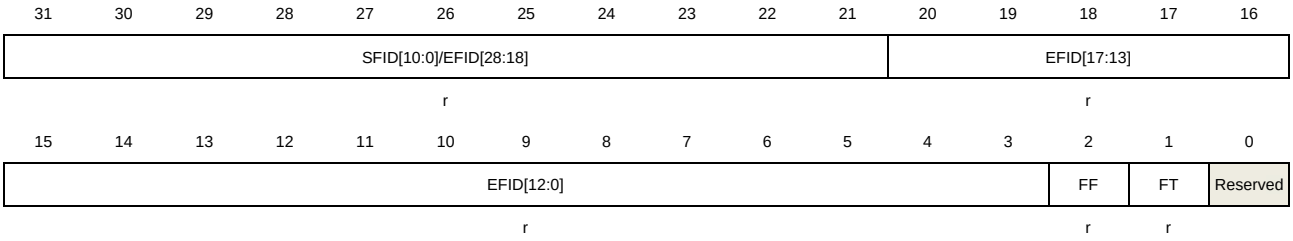


Bits	Fields	Descriptions
31:24	DB7[7:0]	Data byte 7
23:16	DB6[7:0]	Data byte 6
15:8	DB5[7:0]	Data byte 5
7:0	DB4[7:0]	Data byte 4

20.4.13. Receive FIFO mailbox identifier register (CAN_RFIFOMIx) (x=0,1)

Address offset: 0x1B0, 0x1C0
Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)



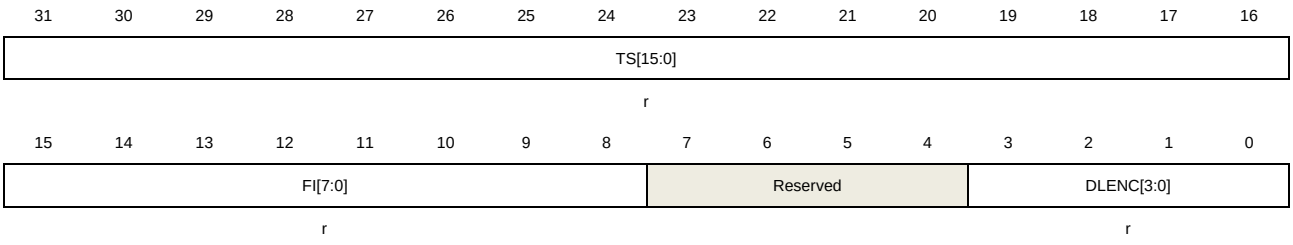
Bits	Fields	Descriptions
31:21	SFID[10:0]/EFID[28:18]	The frame identifier SFID[10:0]: Standard format frame identifier EFID[28:18]: Extended format frame identifier
20:16	EFID[17:13]	The frame identifier EFID[17:13]: Extended format frame identifier
15:3	EFID[12:0]	The frame identifier EFID[12:0]: Extended format frame identifier
2	FF	Frame format 0: Standard format frame 1: Extended format frame
1	FT	Frame type 0: Data frame 1: Remote frame
0	Reserved	Must be kept at reset value

20.4.14. Receive FIFO mailbox property register (CAN_RFIFOMPx) (x=0,1)

Address offset: 0x1B4, 0x1C4

Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)



Bits	Fields	Descriptions
31:16	TS[15:0]	Time stamp The time stamp of frame in transmit mailbox.
15:8	FI[7:0]	Filtering index The index of the filter by which the frame is passed.
7:4	Reserved	Must be kept at reset value
3:0	DLENC[3:0]	Data length code DLENC[3:0] is the number of bytes in a frame.

20.4.15. Receive FIFO mailbox data0 register (CAN_RFIFOMDATA0x) (x=0,1)

Address offset: 0x1B8, 0x1C8

Reset value: 0xXXXX XXXX

This register has to be accessed by word(32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DB5[7:0]								DB4[7:0]							
r								r							

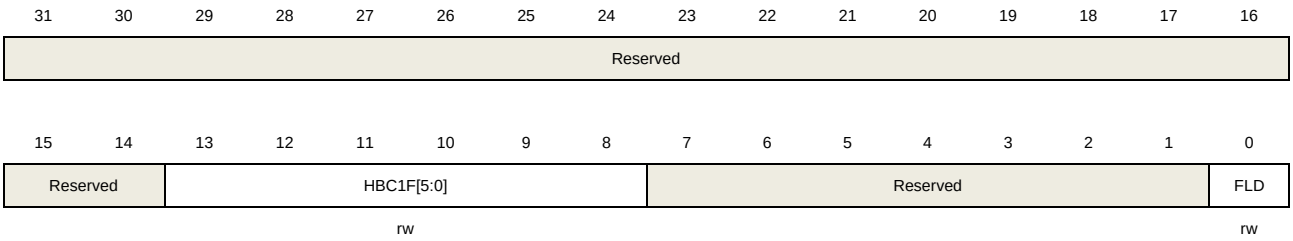
Bits	Fields	Descriptions
31:24	DB7[7:0]	Data byte 7
23:16	DB6[7:0]	Data byte 6
15:8	DB5[7:0]	Data byte 5
7:0	DB4[7:0]	Data byte 4

20.4.17. Filter control register (CAN_FCTL) (Just for CAN0)

Address offset: 0x200

Reset value: 0x2A1C 0E01

This register has to be accessed by word(32-bit)



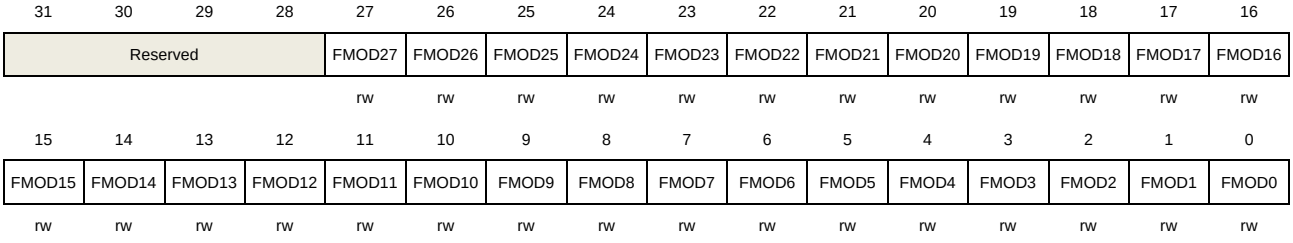
Bits	Fields	Descriptions
31:14	Reserved	Must be kept at reset value
13:8	HBC1F[5:0]	Header bank of CAN1 filter These bits are set and cleared by software to define the first bank for CAN1 filter. Bank0 ~ Bank HBC1F-1 used to CAN0. Bank HBC1F ~ Bank27 used to CAN1. When set 0, not bank used to CAN0. When set 28, not bank used to CAN1.
7:1	Reserved	Must be kept at reset value
0	FLD	Filter lock disable 0: Filter lock enable 1: Filter lock disable

20.4.18. Filter mode configuration register (CAN_FMCFG) (Just for CAN0)

Address offset: 0x204

Reset value: 0x0000 0000

This register has to be accessed by word(32-bit). This register can be modified only when FLD bit in CAN_FCTL register is set.



Bits	Fields	Descriptions
31:28	Reserved	Must be kept at reset value

27:0	FMODx	Filter mode 0: Filter x with Mask mode 1: Filter x with List mode

20.4.19. Filter scale configuration register (CAN_FSCFG) (Just for CAN0)

Address offset: 0x20C
Reset value: 0x0000 0000

This register has to be accessed by word(32-bit). This register can be modified only when FLD bit in CAN_FCTL register is set.

21. Universal serial bus full-speed interface (USBFS)

The USBFS is available on GD32VF103 series.

21.1. Overview

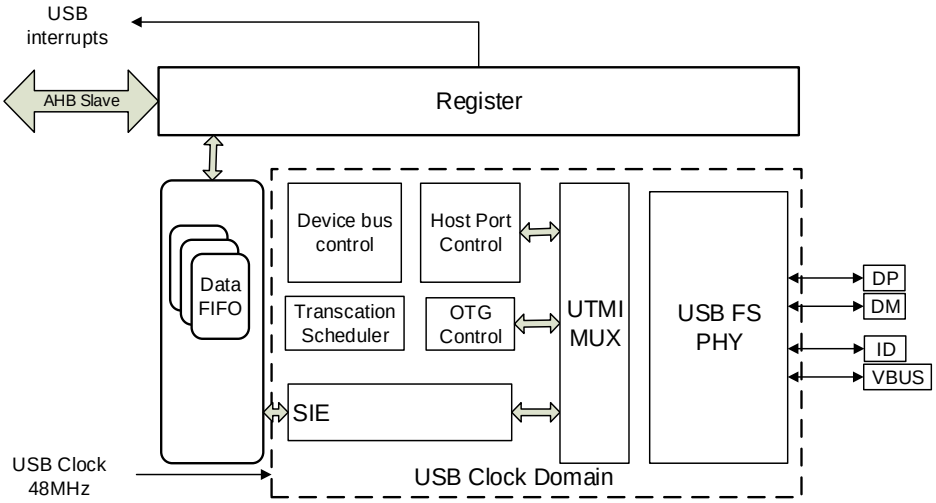
USB Full-Speed (USBFS) controller provides a USB-connection solution for portable devices. USBFS supports host and device modes, as well as OTG mode with HNP (Host Negotiation Protocol) and SRP (Session Request Protocol). USBFS contains a full-speed internal USB PHY and external PHY chip is not contained. USBFS supports all the four types of transfer (control, bulk, Interrupt and isochronous) which defined in USB 2.0 protocol.

21.2. Characteristics

- Supports USB 2.0 host mode at Full-Speed(12Mb/s) or Low-Speed(1.5Mb/s)
- Supports USB 2.0 device mode at Full-Speed(12Mb/s)
- Supports OTG protocol with HNP (Host Negotiation Protocol) and SRP (Session Request Protocol)
- Supports all the 4 types of transfer: control, bulk, interrupt and isochronous
- Includes a USB transaction scheduler in host mode to handle USB transaction request efficiently.
- Includes a 1.25KB FIFO RAM.
- Supports 8 channels in host mode.
- Includes 2 transmit FIFOs (periodic and non-periodic) and a receive FIFO (shared by all channels) in host mode.
- Includes 4 transmit FIFOs (one for each IN endpoint) and a receive FIFO (shared by all OUT endpoints) in device mode.
- Supports 4 OUT and 4 IN endpoints in device mode.
- Supports remote wakeup in device mode.
- Includes a Full-Speed USB PHY with OTG protocol supported.
- Time intervals of SOFs is dynamic adjustable in host mode.
- SOF pulse supports output to pad.
- Supports detecting ID pin level and VBUS voltage.
- Needs external component to supply power for connected USB device in host mode or OTG A-device mode.

21.3. Block diagram

Figure 21-1. USBFS block diagram



21.4. Signal description

Table 21-1. USBFS signal description

I/O port	Type	Description
VBUS	Input	Bus power port
DM	Input/Output	Differential D-
DP	Input/Output	Differential D+
ID	Input	USB identification: Mini connector identification port

21.5. Function overview

21.5.1. USBFS clocks and working modes

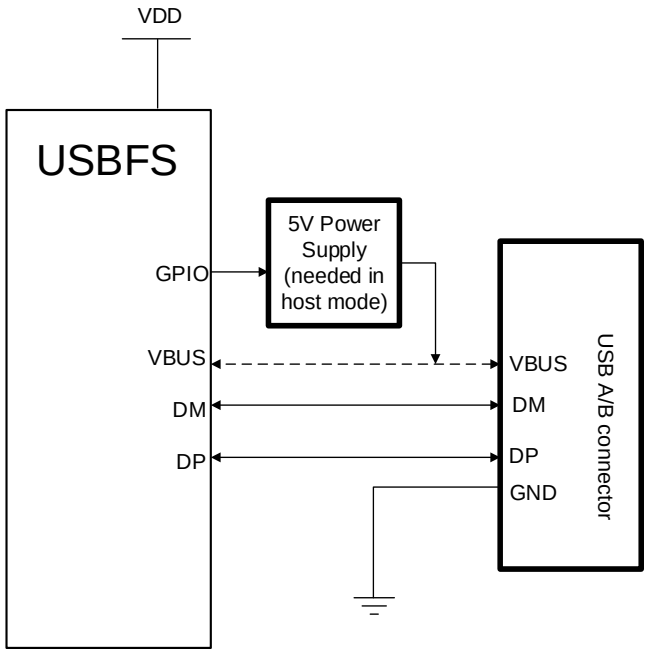
USBFS can operate as a host, a device or a DRD (Dual-role-Device), it contains an internal full-speed PHY.The maximum speed supported by USBFS is full-speed.

The internal PHY supports Full-Speed and Low-Speed in host mode, supports Full-speed in device mode, and supports OTG mode with HNP and SRP. The USB clock used by the USBFS should be 48MHz. The 48MHz USB clock is generated from internal clocks in system, and its source and divider factors are configurable in RCU.

The pull-up and pull-down resistors have already been integrated into the internal PHY and they could be controlled by USBFS automatically according to the current mode (host, device

or OTG mode) and connection status. A typical connection is shown in ***Figure 21-2. Connection with host or device mode***

Figure 21-2. Connection with host or device mode

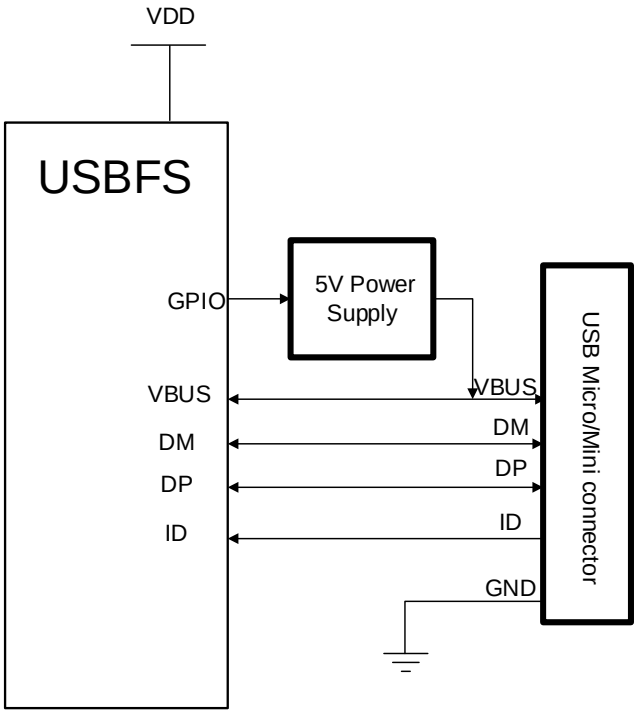


When USBFS works in host mode (FHM bit is set and FDM bit is cleared), the VBUS is 5V power detecting pin used for voltage detection defined in USB protocol. The internal PHY cannot supply 5V VBUS power and only has some voltage comparers, charge and dis-charge circuits on VBUS line. So if application needs VBUS power, an external power supply IC is needed. The VBUS connection between USBFS and the USB connector can be omitted in host mode, so USBFS doesn't detect the voltage level on VBUS pin and always assumes that the 5V power is present.

When USBFS works in device mode (FHM bit is cleared and FDM bit is set), the VBUS detection circuit is connected to a GPIO pin. USBFS continuously monitor the VBUS voltage by the GPIO pin and will immediately switch on the pull-up resistor on DP line once that the VBUS voltage rise above the needed valid value. This will cause a connection. If the VBUS voltage falls below the needed valid value, the pull-up resistor on DP line will be switched off and a disconnection will happen.

The OTG mode connection is described in the ***Figure 21-3. Connection with OTG mode***. When USBFS works in OTG mode, the FHM, FDM bits in USBFS_GUSBCS and VBUSIG bit in USBFS_GCCFG should be cleared. In this mode, the USBFS needs all the four pins: DM, DP, VBUS and ID, and needs to use several voltage comparers to monitor the voltage on these pins. USBFS also contains VBUS charge and discharge circuits to perform SRP request described in OTG protocol. The OTG A-device or B-device is decided by the level of ID pins. USBFS controls the pull-up or pull-down resistor during performing the HNP protocol.

Figure 21-3. Connection with OTG mode

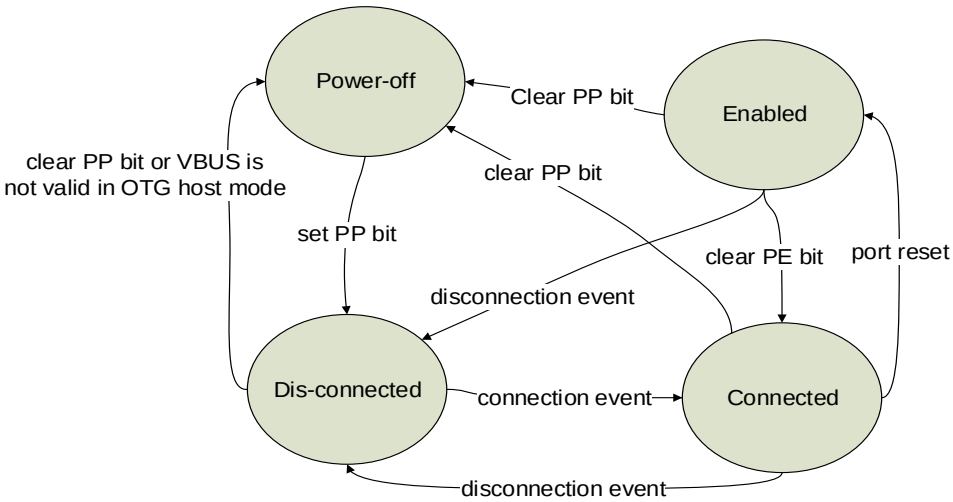


21.5.2. USB host function

USB Host Port State

Host application may control state of the USB port via USBFS_HPCS register. After system initialization, the USB port stays at power-off state. After PP bit is set by software, the internal USB PHY is powered on, and the USB port changes into disconnected state. After a connection is detected, USB port changes into connected state. The USB port changes into enabled state after a port reset is performed on USB bus.

Figure 21-4. State transition diagram of host port



Connection, Reset and Speed identification

As a USB host, USBFS will trigger a connection flag for application after a connection is detected and will trigger a disconnection flag after a disconnection event.

PRST bit is used for USB reset sequence. Application may set this bit to start a USB reset and clear this bit to finish the USB reset. This bit only takes effect when port is at connected or enabled state.

The USBFS performs speed identification during connection, and the speed information will be reported in PS filed in USBFS_HPCS register. USBFS identifies the device speed by the voltage level of DM or DP. As described in USB protocol, full-speed device pulls up DP line while low-speed device pulls up DM line.

Suspend and resume

USBFS supports suspend state and resume operation. When USBFS port is at enabled state, writing 1 to PSP bit in USBFS_HPCS register will cause USBFS to enter suspend state. In suspend state, USBFS stops sending SOFs on USB bus and this will cause the connected USB device to enter suspend state after 3ms. Application can set the PREM bit in USBFS_HPCS register to start a resume sequence to wake up the suspended device and clear this bit to stop the resume sequence. The WKUPIF bit in USBFS_GINTF will be set and the USBFS wake up interrupt will be triggered if a host in suspend state detects a remote wakeup signal.

SOF generate

USBFS sends SOF tokens on USB bus in host mode. As described in USB 2.0 protocol, SOF packets are generated (by the host controller or hub transaction translator) every 1ms in full-speed links.

Each time after USBFS enters into enabled state, it will send the SOF packet periodically which the time is defined in USB 2.0 protocol. In addition, application may adjust the length of a frame by writing FRI filed in USBFS_HFT registers. The FRI bits define the number of USB clock cycles in a frame, so its value should be calculated based on the frequency of USB clock which is used by USBFS. The FRT filed bits show that the remaining clock cycles of the current frame and stop changing during suspend state.

USBFS is able to generate a pulse signal each SOF packet and output it to a pin. The pulse length is 12 HCLK cycle. If application desires to use this function, it needs to set SOFOEN bit in USBFS_GCCFG register and configure the related pin registers in GPIO.

USB Channels and Transactions

USBFS includes 8 independent channels in host mode. Each channel is able to communicate with an endpoint in USB device. The transfer type, direction, packet length and other information are all configured in channel related registers such as USBFS_HCHxCTL and USBFS_HCHxLEN.

USBFS supports all the four kinds of transfer types: control, bulk, interrupts and isochronous.

USB 2.0 protocol divides these transfers into 2 kinds: non-periodic transfer (control and bulk) and periodic transfer (interrupt and isochronous). Based on this, USBFS includes two request queues: periodic request queue and non-periodic request queue, to perform efficient transaction schedule. A request entry in a request queue described above may represent a USB transaction request or a channel operation request.

Application needs to write packet into data FIFO via AHB register interface if it wants to start an OUT transaction on USB bus. USBFS hardware will automatically generate a transaction request entry in request queue after the application writes a whole packet.

The request entries in request queue are processed in order by transaction control module. USBFS always tries to process periodic request queue firstly and secondly process non-periodic request queue.

After a start of frame, USBFS begins to process periodic queue until the queue is empty or bus time required by the current periodic request is not enough, and then process the non-periodic queue. This strategy ensures the bandwidth of periodic transactions in a frame. Each time the USBFS reads and pops a request entry from request queue. If this is a channel disable request, it immediately disables the channel and prepares to process the next entry.

If the current request is a transaction request and the USB bus time is enough for this transaction, USBFS will employ SIE to generate this transaction on USB bus.

When the required bus time for the current request is not enough in the current frame, and if this is a periodic request, USBFS stops processing the periodic queue and starts to process non-periodic request. If this is a non-periodic queue the USBFS will stop processing any queue and wait until the end of current frame.

21.5.3. USB device function

USB Device Connection

In device mode, USBFS stays at power-off state after initialization. After connecting to a USB host with 5V power supply through VBUS pin or setting VBUSIG bit in USBFS_GCCFG register, USBFS enters into powered state. USBFS begins to switch on the pull-up resistor on DP line, thus, host side will detect a connection event.

Reset and Speed-Identification

The USB host always starts a USB reset when it detects a device connection, and USBFS in device mode will trigger a reset interrupt by hardware when it detects the reset event on USB bus.

After reset sequence, USBFS will trigger an ENUMF interrupt in USBFS_GINTF register and reports current enumerated device speed in ES bits in USBFS_DSTAT register, this bit field is always 11(full-speed).

As required by USB 2.0 protocol, USBFS doesn’t support low-speed in device mode.

Suspend and Wake-up

A USB device will enter into suspend state when the USB bus stays at IDLE state and there is no change on data lines for 3ms. When USB device is in suspend state, most of its clock are closed to save power. The USB host is able to wake up the suspended device by generating a resume signal on USB bus. When USBFS detects the resume signal, the WKUPIF flag in USBFS_GINTF register will be set and the USBFS wake up interrupt will be triggered.

In suspend mode, USBFS is also able to remotely wake up the USB bus. Software may set RWKUP bit in USBFS_DCTL register to send a remote wake-up signal, and if remote wake-up is supported in USB host, the host will begin to send resume signal on USB bus.

Soft Disconnection

USBFS supports soft disconnection. After the device is powered on, USBFS will switch on the pull-up resistor on DP line so that the host can detect the connection. It is able to force a disconnection by setting the SD bit in USBFS_DCTL register. After the SD bit is set, USBFS will directly switch off the pull-up resistor, so that USB host will detect a disconnection on USB bus.

SOF tracking

When USBFS receives a SOF packet on USB bus, it will trigger a SOF interrupt and begin to count the bus time using local USB clock. The frame number of the current frame is reported in FNRSOF filed in USBFS_DSTAT register. When the USB bus time reaches EOF1 or EOF2 point (End of Frame, described in USB 2.0 protocol), USBFS will trigger an EOPFIF interrupt in USBFS_GINTF register. These flags and registers can be used to get current bus time and position information.

21.5.4. OTG function overview

USBFS supports OTG function described in OTG protocol 1.3, OTG function includes SRP and HNP protocols.

A-Device and B-Device

A-Device is an OTG capable USB device with a Standard-A or Micro-A plug inserted into its receptacle. The A-Device supplies power to VBUS and it is host at the start of a session. B-Device is an OTG capable USB device with a Standard-B, Micro-B or Mini-B plug inserted into its receptacle, or a captive cable ending being a Standard-A plug. The B-Device is a peripheral at the start of a session. USBFS uses the voltage level of ID pin to identify A-Device or B-Device. The ID status is reported in IDPS bit in USBFS_GOTGCS register. For the details of transfer states between A-Device and B-Device, please refer to OTG 1.3 protocol.

HNP

The Host Negotiation Protocol (HNP) allows the host function to be switched between two directly connected On-The-Go devices and eliminates the necessity of switching the cable

connections for the change of control of communications between the devices. HNP will be initialized typically by the user or an application on the On-The-Go B-Device. HNP may only be implemented through the Micro-AB receptacle on a device.

Since On-The-Go devices have a Micro-AB receptacle, an On-The-Go device can default to being either a host or a device, depending that which type of plug (Micro-A plug for host, Micro-B plug for device) is inserted. By utilizing the Host Negotiation Protocol (HNP), an On-The-Go B-Device, which is the default device, may make a request to be a host. The process for the exchange of the role to a host is described in this section. This protocol eliminates the necessity of switching the cable connection for the change of the roles of the connected devices.

When USBFS is in OTG A-Device host mode and it wants to give up its host role, it may firstly set PSP bit in USBFS_HPCS register to make the USB bus enter in suspend status. Then, the B-Device will enter in suspend state 3ms later. If the B-Device wants to change to be a host, HNPREQ bit in USBFS_GOTGCS register should be set and the USBFS will begin to perform HNP protocol on bus, and at last, the result of HNP is reported in HNPS bit in USBFS_GOTGCS register. Besides, it is always available to get the current role (host or device) from COPM bit in USBFS_GINTF register.

SRP

The Session Request Protocol (SRP) allows a B-Device to request the A-Device to turn on VBUS and start a session. This protocol allows the A-Device, which may be battery powered, to conserve power by turning VBUS off when there is no bus activity while still providing a means for the B-Device to initiate bus activity. As described in OTG protocol, an OTG device must compare VBUS voltage with several threshold values and the compare result should be reported in ASV and BSV bits in USBFS_GOTGCS register.

Set SRPREQ bit in USBFS_GOTGCS register to start a SRP request when USBFS is in B-Device OTG mode and USBFS will generate a success flag SRPS in USBFS_GOTGCS register if the SRP request successfully.

When USBFS is in OTG A-Device mode and it has detected a SRP request from a B-Device, it sets a SESIF flag in USBFS_GINTF register. The 5V power supply for VBUS pin should be prepared to switch on after getting this flag.

21.5.5. Data FIFO

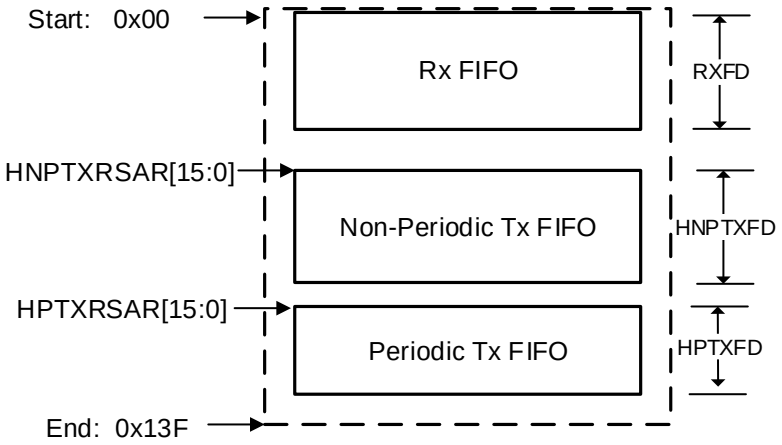
The USBFS contains a 1.25K bytes data FIFO for packet data storage. The data FIFO is implemented by using an internal SRAM in USBFS.

Host Mode

In host mode, the data FIFO space is divided into 3 parts: Rx FIFO for received packet, Non-Periodic Tx FIFO for non-period transmission packet and Periodic Tx FIFO for periodic transmission packet. All IN channels shares the Rx FIFO for packets reception. All the periodic OUT channels share the periodic Tx FIFO to packets tramsmission. All the non-

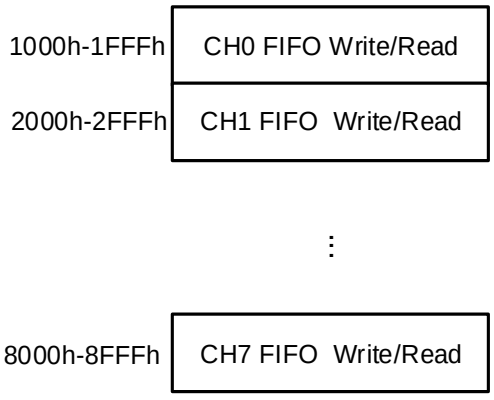
periodic OUT channels share the non-Periodic Tx FIFO for transmit packets. The size and start offset of these data FIFOs should be configured using these registers: USBFS_GRFLEN, USBFS_HNPTFLEN and USBFS_HPTFLEN. ***Figure 21-5. HOST mode FIFO space in SRAM*** describes the structure of these FIFOs in SRAM. The values in the figure are in term of 32-bit words.

Figure 21-5. HOST mode FIFO space in SRAM



USBFS provides a special register area for the internal data FIFO reading and writing. ***Figure 21-6. Host mode FIFO access register map*** describes the register memory area that the data FIFO can write. This area can be read by any channel data FIFO.The addresses in the figure are addressed in bytes. Each channel has its own FIFO access register space, although all Non-periodic channels share the same FIFO and all the Periodic channels also share the same FIFO. It is important for USBFS to know which channel the current pushed packet belongs to. Rx FIFO is also able to be accessed using USBFS_GRSTATR/ USBFS_GRSTATP register.

Figure 21-6. Host mode FIFO access register map

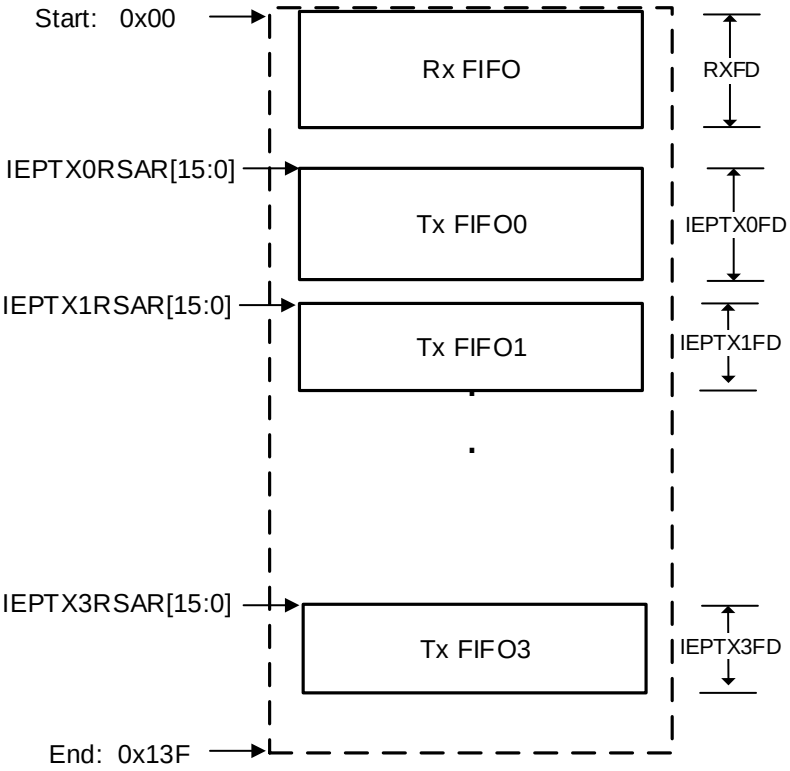


Device mode

In device mode, the data FIFO is divided into several parts: one Rx FIFO, and 4 Tx FIFOs (one for each IN endpoint). All the OUT endpoints share the Rx FIFO for receiving packets. The size and start offset of these data FIFOs should be configured using USBFS_GRFLEN

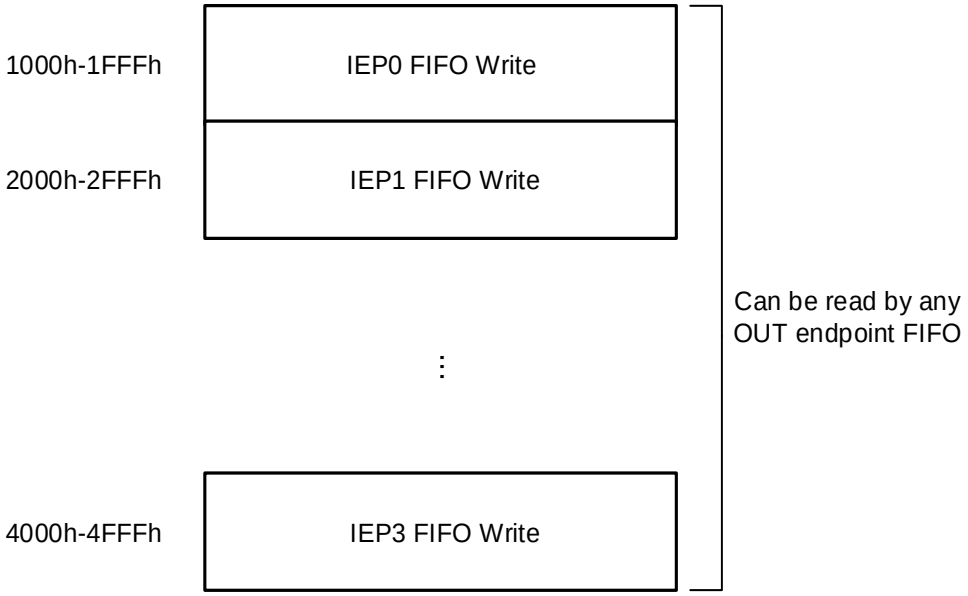
and USBFS_DIEPxTFLEN (x=0…3) registers. ***Figure 21-7. Device mode FIFO space in SRAM*** describes the structure of these FIFOs in SRAM. The values in the figure are in term of 32-bit words.

Figure 21-7. Device mode FIFO space in SRAM



USBFS provides a special register area for the internal data FIFO reading and writing. ***Figure 21-8. Device mode FIFO access register map*** describes the register memory area where the data FIFO can write. This area can be read by any endpoint FIFO. The addresses in the figure are addressed in bytes. Each endpoint has its own FIFO access register space. Rx FIFO is also able to be accessed using USBFS_GRSTATR/USBFS_GRSTATP register.

Figure 21-8. Device mode FIFO access register map



21.5.6. Operation guide

This section describes the advised operation guide for USBFS.

Host mode

Global register initialization sequence

1. Program USBFS_GAHBCS register according to application's demand, such as the TxFIFO's empty threshold, etc. GINTEN bit should be kept cleared at this time.
2. Program USBFS_GUSBCS register according to application's demand, such as the operation mode (host, device or OTG) and some parameters of OTG and USB protocols.
3. Program USBFS_GCCFG register according to application's demand.
4. Program USBFS_GRFLEN, USBFS_HNPTFLEN_DIEP0TFLEN and USBFS_HPTFLEN register to configure the data FIFOs according to application's demand.
5. Program USBFS_GINTEN register to enable Mode Fault and Host Port interrupt and set GINTEN bit in USBFS_GAHBCS register to enable global interrupt.
6. Program USBFS_HPCS register and set PP bit.
7. Wait for a device's connection, and once a device is connected, the connection interrupt PCD in USBFS_HPCS register will be triggered. Then set PRST bit to perform a port reset. Wait for at least 10ms and then clear PRST bit.
8. Wait PEDC interrupt in USBFS_HPCS register and then read PE bit to ensure that the port is successfully enabled. Read PS [1:0] bits to get the connected device's speed and then program USBFS_HFT register to change the SOF interval if needed.

Channel initialization and enable sequence

1. Program USBFS_HCHxCTL registers with desired transfer type, direction, packet size, etc. Ensure that CEN and CDIS bits keep cleared during configuration.
2. Program USBFS_HCHxINTEN register. Set the desired interrupt enable bits.
3. Program USBFS_HCHxLEN register. PCNT is the number of packets in a transfer and TLEN is the total bytes number of all the transmitted or received packets in a transfer.

   For OUT channel: If PCNT=1, the single packet's size is equal to TLEN. If PCNT>1, the former PCNT-1 packets are considered as max-packet-length packets whose size are defined by MPL field in USBFS_HCHxCTL register, and the last packet's size is calculated based on PCNT, TLEN and MPL. If software want s to send out a zero-length packet, it should program TLEN=0, PCNT=1.

   For IN channel: Because the application doesn't know the actual received data size before the IN transaction finishes, TLEN can be set to a maximum possible value supported by Rx FIFO.
4. Set CEN bit in USBFS_HCHxCTL register to enable the channel.

Channel disable sequence

Software can disable the channel by setting both CEN and CDIS bits at the same time. USBFS will generate a channel disable request entry in request queue after the register setting operation. When the request entry reaches the top of request queue, it is processed by USBFS immediately:

For OUT channels, the specified channel will be disabled immediately. Then, a CH flag will be generated and the CEN and CDIS bits will be cleared by USBFS.

For IN channels, USBFS pushes a channel disable status entry into Rx FIFO. Software should then handle the Rx FIFO not empty event: read and pop this status entry, then, a CH flag will be generated and the CEN and CDIS bits will be cleared.

IN transfers operation sequence

1. Initialize USBFS global registers.
2. Initialize the channel.
3. Enable the channel.
4. After the IN channel is enabled by software, USBFS generates an Rx request entry in the corresponding request queue.
5. When the Rx request entry reaches the top of the request queue, USBFS begins to process this request entry. If bus time for the IN transaction indicated by the request entry is enough, USBFS starts the IN transaction on USB bus.
6. If the IN transaction finishes successfully (ACK handshake received), USBFS pushes the

received data packet into the Rx FIFO and triggers ACK flag. Otherwise, the status flag (NAK) reports the transaction result.

7. If the IN transaction described in step 5 is successful and PCNT is larger than 1 in step2, return to step 3 and continues to receive the remaining packets. If the IN transaction described in step 5 is not successful, return to step 3 to re-receive the packet again.
8. After all the transactions in a transfer are successfully received on USB bus, USBFS pushes a TF status entry into the Rx FIFO on top of the last packet data. Thus after reading and poping all the received data packet, the TF status entry is need, USBFS generates TF flag to indicate that the transfer successfully finishes.
9. Disable the channel. Now the channel is in IDLE state and is ready for other transfers.

OUT transfers operation sequence

1. Initialize USBFS global registers.
2. Initialize and enable the channel.
3. Write a packet into the channel's Tx FIFO (Periodic Tx FIFO or non-periodic Tx FIFO). After the whole packet data is written into the FIFO, USBFS generates a Tx request entry in the corresponding request queue and decreases the TLEN field in USBFS_HCHxLEN register by the written packet's size.
4. When the request entry reaches the top of the request queue, USBFS begins to process this request entry. If bus time for the transaction indicated by the request entry is enough, USBFS starts the OUT transaction on USB bus.
5. When the OUT transaction indicated by the request entry finishes on USB bus, PCNT in USBFS_HCHxLEN register is decreased by 1. If the transaction finishes successfully (ACK handshake received), the ACK flag is triggered. Otherwise, the status flag (NAK) reports the transaction result.
6. If the OUT transaction described in step 5 is successful and PCNT is larger than 1 in step2, return to step 3 and continues to send the remaining packets. If the OUT transaction described in step 5 is not successful, return to step 3 to resend the packet again.
7. After all the transactions in a transfer are successfully sent on USB bus, USBFS generates TF flag to indicate that the transfer successfully finishes.
8. Disable the channel. Now the channel is in IDLE state and is ready for other transfers.

Device mode

Global register initialization sequence

1. Program USBFS_GAHBCS register according to application's demand, such as the TxFIFO's empty threshold, etc. GINTEN bit should be kept cleared at this time.

2. Program USBFS_GUSBCS register according to application's demand, such as: the operation mode (host, device or OTG) and some parameters of OTG and USB protocols.
3. Program USBFS_GCCFG register according to application's demand.
4. Program USBFS_GRFLEN, USBFS_HNPTFLEN_DIEP0TFLEN, USBFS_DIEPxTFLEN register to configure the data FIFOs according to application's demand.
5. Program USBFS_GINTEN register to enable Mode Fault, Suspend, SOF, Enumeration Done and USB Reset interrupt and then, set GINTEN bit in USBFS_GAHBCS register to enable global interrupt.
6. Program USBFS_DCFG register according to application's demand, such as the device address, etc.
7. After the device is connected to a host, the host will perform port reset on USB bus and this will trigger the RST interrupt in USBFS_GINTF register.
8. Wait for ENUMF interrupt in USBFS_GINTF register.

Endpoint initialization and enable sequence

1. Program USBFS_DIEPxCTL or USBFS_DOEPxCTL register with desired transfer type, packet size, etc.
2. Program USBFS_DIEPINTEN or USBFS_DOEPINTEN register. Set the desired interrupt enable bits.
3. Program USBFS_DIEPxLEN or USBFS_DOEPxLEN register. PCNT is the number of packets in a transfer and TLEN is the total byte number of all the transmitted or received packets in a transfer.

   For IN endpoint：If PCNT=1, the single packet's size is equal to TLEN. If PCNT>1, the former PCNT-1 packets are considered as max-packet-length packets whose size are defined by MPL field in USBFS_DIEPxCTL register, and the last packet's size is calculated based on PCNT, TLEN and MPL. If a zero-length packet is required to be sent, it should program TLEN=0, PCNT=1.

   For OUT endpoint：Because the application doesn't know the actual received data size before the OUT transaction finishes, TLEN can be set to a maximum possible value supported by Rx FIFO.
4. Set EPEN bit in USBFS_DIEPxCTL or USBFS_DOEPxCTL register to enable the endpoint.

Endpoint disable sequence

The endpoint can be disabled anytime when the EPEN bit in USBFS_DIEPxCTL or USBFS_DOEPxCTL registers is cleared.

IN transfers operation sequence

1. Initialize USBFS global registers.
2. Initialize and enable the IN endpoint.
3. Write packets into the endpoint's Tx FIFO. Each time a data packet is written into the FIFO, USBFS decreases the TLEN field in USBFS_DIEPxLEN register by the written packet's size.
4. When an IN token received, USBFS transmits the data packet, and after the transaction finishes on USB bus, PCNT in USBFS_DIEPxLEN register is decreased by 1. If the transaction finishes successfully (ACK handshake received), the ACK flag is triggered. Otherwise, the status flags report the transaction result.
5. After all the data packets in a transfer are successfully sent on USB bus, USBFS generates TF flag to indicate that the transfer successfully finishes and disables the IN endpoint.

OUT transfers operation sequence

1. Initialize USBFS global registers.
2. Initialize the endpoint and enable the endpoint.
3. When an OUT token received, USBFS receives the data packet or response with an NAK handshake based on the status of Rx FIFO and register configuration. If the transaction finishes successfully (USBFS receives and saves the data packet into Rx FIFO successfully and sends ACK handshake on USB bus), PCNT in USBFS_DOEPxLEN register is decreased by 1 and the ACK flag is triggered, otherwise, the status flags report the transaction result.
4. After all the data packets in a transfer are successfully received on USB bus, USBFS pushes a TF status entry into the Rx FIFO on top of the last packet data. Thus after reading and poping all the received data packet, the TF status entry is read, USBFS generates TF flag to indicate that the transfer successfully finishes and disables the OUT endpoint.

21.6. Interrupts

USBFS has two interrupts: global interrupt and wake-up interrupt.

The source flags of the global interrupt are readable in USBFS_GINTF register and are listed in ***Table 21-2. USBFS global interrupt***.

Table 21-2. USBFS global interrupt

Interrupt Flag	Description	Operation Mode
SESIF	Session interrupt	Host or device mode
DISCIF	Disconnect interrupt flag	Host Mode
IDPSC	ID pin status change	Host or device mode

Interrupt Flag	Description	Operation Mode
PTXFEIF	Periodic Tx FIFO empty interrupt flag	Host Mode
HCIF	Host channels interrupt flag	Host Mode
HPIF	Host port interrupt flag	Host Mode
ISOONCIF/PXNCIF	Periodic transfer Not Complete Interrupt flag /Isochronous OUT transfer Not Complete Interrupt Flag	Host or device mode
ISOINCIF	Isochronous IN transfer Not Complete Interrupt Flag	Device mode
OEPIF	OUT endpoint interrupt flag	Device mode
IEPIF	IN endpoint interrupt flag	Device mode
EOPFIF	End of periodic frame interrupt flag	Device mode
ISOOPDIF	Isochronous OUT packet dropped interrupt flag	Device mode
ENUMF	Enumeration finished	Device mode
RST	USB reset	Device mode
SP	USB suspend	Device mode
ESP	Early suspend	Device mode
GONAK	Global OUT NAK effective	Device mode
GNPINAK	Global IN Non-Periodic NAK effective	Device mode
NPTXFEIF	Non-Periodic Tx FIFO empty interrupt flag	Host Mode
RXFNEIF	Rx FIFO non-empty interrupt flag	Host or device mode
SOF	Start of frame	Host or device mode
OTGIF	OTG interrupt flag	Host or device mode
MFIF	Mode fault interrupt flag	Host or device mode

Wake-up interrupt can be triggered when USBFS is in suspend state, even when the USBFS's clocks are stopped. The source of the wake-up interrupt is WKUPIF bit in USBHS_GINTF register.

21.7. Register definition

USBFS base address: 0x5000 0000

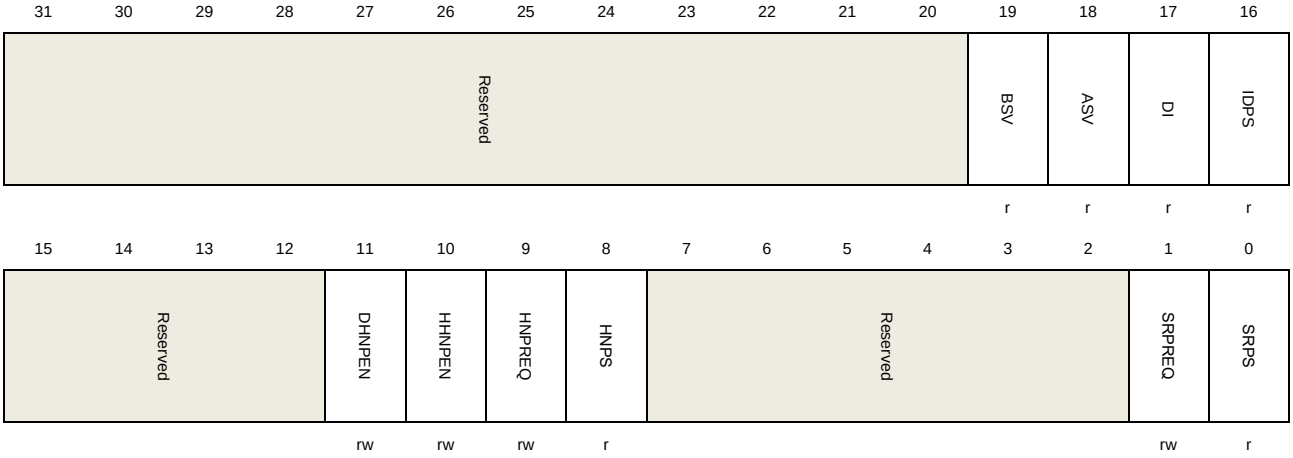
21.7.1. Global control and status registers

Global OTG control and status register (USBFS_GOTGCS)

Address offset: 0x0000

Reset value: 0x0000 0800

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:20	Reserved	Must be kept at reset value
19	BSV	B-Session Valid (described in OTG protocol). 0: Vbus voltage level of a OTG B-Device is below VBSESSVLD 1: Vbus voltage level of a OTG B-Device is above VBSESSVLD Note: Only accessible in OTG B-Device mode.
18	ASV	A- Session valid A-host mode transceiver status. 0: Vbus voltage level of a OTG A-Device is below VASESSVLD 1: Vbus voltage level of a OTG A-Device is above VASESSVLD The A-Device is the default host at the start of a session. Note: Only accessible in OTG A-Device mode.
17	DI	Debounce interval Debounce interval of a detected connection. 0: Indicates the long debounce interval, when a plug-on and connection occurs on USB bus 1: Indicates the short debounce interval, when a soft connection is used in HNP

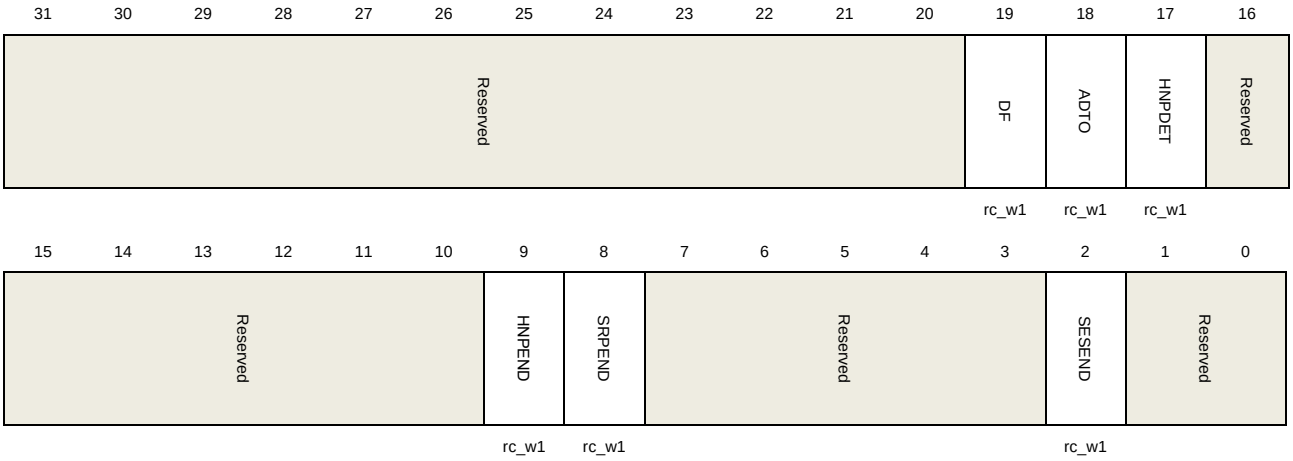
		protocol. Note: Only accessible in host mode.
16	IDPS	ID pin status Voltage level of connector ID pin 0: USBFS is in A-Device mode 1: USBFS is in B-Device mode Note: Accessible in both device and host modes.
15:12	Reserved	Must be kept at reset value
11	DHNPEN	Device HNP enable Enable the HNP function of a B-Device. If this bit is cleared, USBFS doesn't start HNP protocol when application set HNPREQ bit in USBFS_GOTGCS register. 0: HNP function is not enabled. 1: HNP function is enabled Note: Only accessible in device mode.
10	HHNPEN	Host HNP enable Enable the HNP function of an A-Device. If this bit is cleared, USBFS doesn't response to the HNP request from B-Device. 0: HNP function is not enabled. 1: HNP function is enabled Note: Only accessible in host mode.
9	HNPREQ	HNP request This bit is set by software to start a HNP on the USB. This bit can be cleared when HNPEND bit in USBFS_GOTGINTF register is set, by writing zero to it, or clearing the HNPEND bit in USBFS_GOTGINTF register. 0: Don't send HNP request 1: Send HNP request Note: Only accessible in device mode.
8	HNPS	HNP successes This bit is set by the core when HNP succeeds, and this bit is cleared when HNPREQ bit is set. 0: HNP fails 1: HNP succeeds Note: Only accessible in device mode.
7:2	Reserved	Must be kept at reset value
1	SRPREQ	SRP request This bit is set by software to start a SRP on the USB. This bit can be cleared when SRPEND bit in USBFS_GOTGINTF register is set, by writing zero to it, or clearing the SRPEND bit in USBFS_GOTGINTF register. 0: No session request

		1: Session request Note: Only accessible in device mode.
0	SRPS	SRP success This bit is set by the core when SRP succeeds, and this bit is cleared when SRPREQ bit is set. 0: SRP fails 1: SRP succeeds Note: Only accessible in device mode.

Global OTG interrupt flag register (USBFS_GOTGINTF)

Address offset: 0x0004
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:20	Reserved	Must be kept at reset value
19	DF	Debounce finish Set by USBFS when the debounce during device connection is done. Note: Only accessible in host mode.
18	ADTO	A-Device timeout Set by USBFS when the A-Device's waiting for a B-Device' connection has timed out. Note: Accessible in both device and host modes.
17	HNPDET	Host negotiation request detected Set by USBFS when A-Device detects a HNP request. Note: Accessible in both device and host modes.
16:10	Reserved	Must be kept at reset value

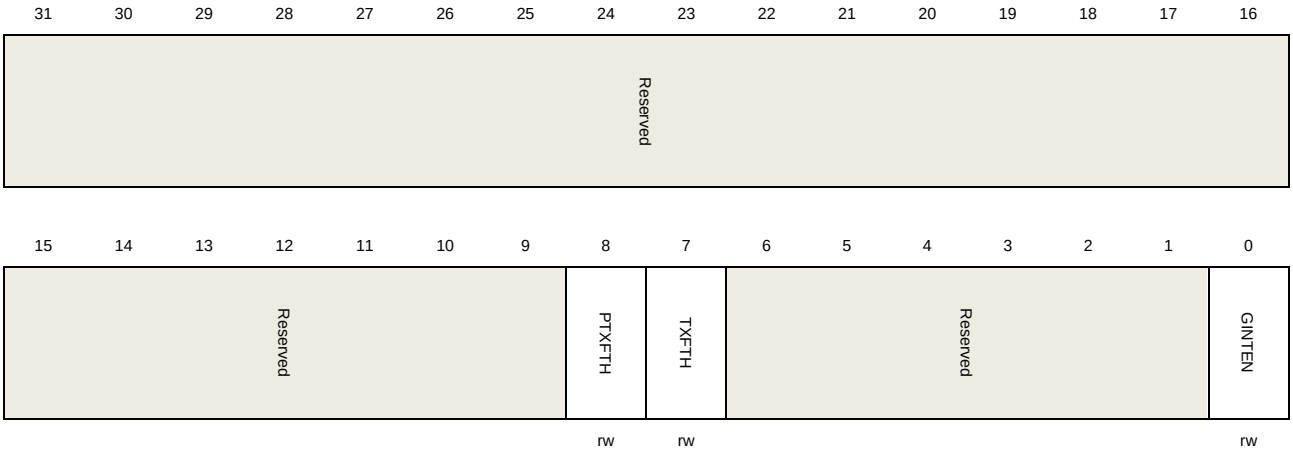
9	HNPEND	HNP end Set by the core when a HNP ends. Read the HNPS in USBFS_GOTGCS register to get the result of HNP. Note: Accessible in both device and host modes.
8	SRPEND	SRPEND Set by the core when a SRP ends. Read the SRPS in USBFS_GOTGCS register to get the result of SRP. Note: Accessible in both device and host modes.
7:3	Reserved	Must be kept at reset value
2	SESEND	Session end Set by the core when VBUS voltage is below Vb_ses_vld.
1:0	Reserved	Must be kept at reset value

Global AHB control and status register (USBFS_GAHBCS)

Address offset: 0x0008

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:9	Reserved	Must be kept at reset value
8	PTXFTH	Periodic Tx FIFO threshold 0: PTXFEIF will be triggered when the periodic transmit FIFO is half empty 1: PTXFEIF will be triggered when the periodic transmit FIFO is completely empty Note: Only accessible in host mode.
7	TXFTH	Tx FIFO threshold Device mode: 0: TXFEIF will be triggered when the IN endpoint transmit FIFO is half empty

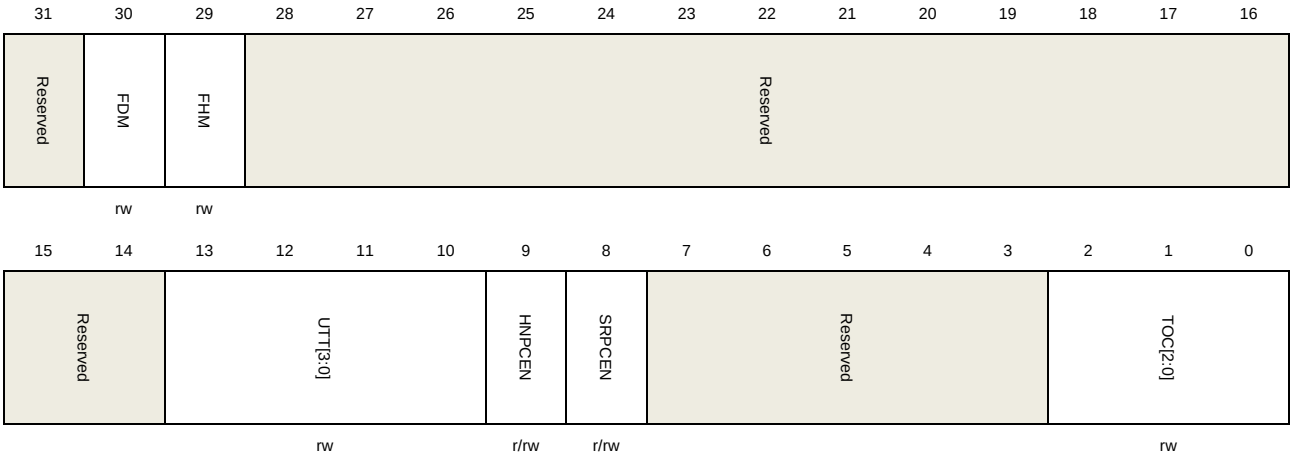
		1: TXFEIF will be triggered when the IN endpoint transmit FIFO is completely empty Host mode: 0: NPTXFEIF will be triggered when the non-periodic transmit FIFO is half empty 1: NPTXFEIF will be triggered when the non-periodic transmit FIFO is completely empty
6：1	Reserved	Must be kept at reset value
0	GINTEN	Global interrupt enable 0: Global interrupt is not enabled. 1: Global interrupt is enabled. Note: Accessible in both device and host modes.

Global USB control and status register (USBFS_GUSBCS)

Address offset: 0x000C

Reset value: 0x0000 0A80

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31	Reserved	Must be kept at reset value
30	FDM	Force device mode Setting this bit will force the core to device mode irrespective of the USBFS ID input pin. 0: Normal mode 1: Device mode The application must wait at least 25 ms for the change taking effect after setting the force bit. Note: Accessible in both device and host modes.
29	FHM	Force host mode Setting this bit will force the core to host mode irrespective of the USBFS ID input

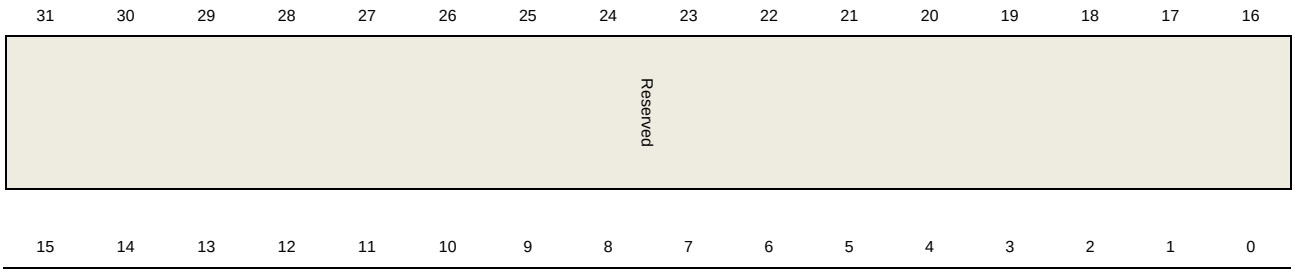
		pin. 0: Normal mode 1: Host mode The application must wait at least 25 ms for the change taking effect after setting the force bit. Note: Accessible in both device and host modes.
28:14	Reserved	Must be kept at reset value
13:10	UTT[3:0]	USB turnaround time Turnaround time in PHY clocks. Note: Only accessible in device mode.
9	HNPCEN	HNP capability enable Controls whether the HNP capability is enabled 0: HNP capability is disabled 1: HNP capability is enabled Note: Accessible in both device and host modes.
8	SRPCEN	SRP capability enable Controls whether the SRP capability is enabled 0: SRP capability is disabled 1: SRP capability is enabled Note: Accessible in both device and host modes.
7:3	Reserved	Must be kept at reset value
2:0	TOC[2:0]	Timeout calibration USBFS always uses time-out value required in USB 2.0 when waiting for a packet. Application may use TOC [2:0] to add the value is in terms of PHY clock. (The frequency of PHY clock is 48MHZ.).

Global reset control register (USBFS_GRSTCTL)

Address offset: 0x0010
Reset value: 0x8000 0000

The application uses this register to reset various hardware features inside the core.

This register has to be accessed by word (32-bit)



Reserved	TXFNUM[4:0]	TXFF	RXFF	Reserved	HFCRST	HCSRST	CSRST
	rw	rs	rs		rs	rs	rs

Bits	Fields	Descriptions
31:11	Reserved	Must be kept at reset value
10:6	TXFNUM[4:0]	Tx FIFO number Indicates which Tx FIFO will be flushed when TXFF bit in the same register is set. Host Mode: 00000: Only non-periodic Tx FIFO is flushed 00001: Only periodic Tx FIFO is flushed 1XXXX: Both periodic and non-periodic Tx FIFOs are flushed Other: Non data FIFO is flushed Device Mode: 00000: Only Tx FIFO0 is flushed 00001: Only Tx FIFO1 is flushed … 00011: Only Tx FIFO3 is flushed 1XXXX: All Tx FIFOs are flushed Other: Non data FIFO is flushed
5	TXFF	Tx FIFO flush Application set this bit to flush data Tx FIFOs and TXFNUM[4:0] bits decide the FIFO number to be flushed. Hardware automatically clears this bit after the flush process completes. After setting this bit, application should wait until this bit is cleared before any other operation on USBFS. Note: Accessible in both device and host modes.
4	RXFF	Rx FIFO flush Application set this bit to flush data Rx FIFO. Hardware automatically clears this bit after the flush process completes. After setting this bit, application should wait until this bit is cleared before any other operation on USBFS. Note: Accessible in both device and host modes.
3	Reserved	Must be kept at reset value
2	HFCRST	Host frame counter reset Set by the application to reset the frame number counter in USBFS. After this bit is set, the frame number of the following SOF returns to 0. Hardware automatically clears this bit after the reset process completes. After setting this bit, application should wait until this bit is cleared before any other operation on USBFS. Note: Only accessible in host mode.
1	HCSRST	HCLK soft reset

Set by the application to reset AHB clock domain circuit.
Hardware automatically clears this bit after the reset process completes. After setting this bit, application should wait until this bit is cleared before any other operation on USBFS.
Note: Accessible in both device and host modes.

0 CSRST Core soft reset
Resets the AHB and USB clock domains circuits, as well as most of the registers.

Global interrupt flag register (USBFS_GINTF)

Address offset: 0x0014
Reset value: 0x0400 0021

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WKUPIF	SESIF	DISCIF	IDPSC	Reserved.	PTXFEIF	HCIF	HPIF	Reserved		PXNCIF/ ISOONCIF	ISOINCIF	OEPIF	IEPIF	Reserved	
rc_w1	rc_w1	rc_w1	rc_w1		r	r	r			rc_w1	rc_w1	r	r		

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1			r	r	r	r	rc_w1	r	rc_w1	r

Bits	Fields	Descriptions
31	WKUPIF	Wakeup interrupt flag This interrupt is triggered when a resume signal (in device mode) or a remote wakeup signal (in host mode) is detected on the USB. Note: Accessible in both device and host modes.
30	SESIF	Session interrupt flag This interrupt is triggered when a SRP is detected (in A-Device mode) or V_{BUS} becomes valid for a B- Device (in B-Device mode). Note: Accessible in both device and host modes.
29	DISCIF	Disconnect interrupt flag This interrupt is triggered after a device disconnection. Note: Only accessible in host mode.
28	IDPSC	ID pin status change Set by the core when ID status changes.

		Note: Accessible in both device and host modes.
27	Reserved	Must be kept at reset value
26	PTXFEIF	Periodic Tx FIFO empty interrupt flag This interrupt is triggered when the periodic transmit FIFO is either half or completely empty. The threshold is determined by the periodic Tx FIFO empty level bit (PTXFTH) in the USBFS_GAHBCS register. Note: Only accessible in host mode.
25	HCIF	Host channels interrupt flag Set by USBFS when one of the channels in host mode has raised an interrupt. First read USBFS_ HACHINT register to get the channel number, and then read the corresponding USBFS_HCHxINTF register to get the flags of the channel that cause the interrupt. This bit will be automatically cleared after the respective channel's flags which cause channel interrupt are cleared. Note: Only accessible in host mode.
24	HPIF	Host port interrupt flag Set by the core when USBFS detects that port status changes in host mode. Software should read USBFS_HPCS register to get the source of this interrupt. This bit will be automatically cleared after the flags that causing a port interrupt are cleared. Note: Only accessible in host mode.
23:22	Reserved	Must be kept at reset value
21	PXNCIF	Periodic transfer Not Complete Interrupt flag USBFS sets this bit when there are periodic transactions for current frame not completed at the end of frame. (Host mode)
	ISOONCIF	Isochronous OUT transfer Not Complete Interrupt Flag At the end of a periodic frame (defined by EOPFT bit in USBFS_DCFG), USBFS will set this bit if there are still isochronous OUT endpoints for that not completed transactions. (Device Mode)
20	ISOINCIF	Isochronous IN transfer Not Complete Interrupt Flag At the end of a periodic frame (defined by EOPFT [1:0] bits in USBFS_DCFG), USBFS will set this bit if there are still isochronous IN endpoints for that not completed transactions. (Device Mode) Note: Only accessible in device mode.
19	OEPIF	OUT endpoint interrupt flag Set by USBFS when one of the OUT endpoints in device mode has raised an interrupt. Software should first read USBFS_DAEPINT register to get the device number, and then read the corresponding USBFS_DOEPxINTF register to get the flags of the endpoint that cause the interrupt. This bit will be automatically cleared after the respective endpoint's flags which cause this interrupt are cleared.

		Note: Only accessible in device mode.
18	IEPIF	IN endpoint interrupt flag Set by USBFS when one of the IN endpoints in device mode has raised an interrupt. Software should first read USBFS_DAEPINT register to get the device number, and then read the corresponding USBFS_DIEPxINTF register to get the flags of the endpoint that cause the interrupt. This bit will be automatically cleared after the respective endpoint's flags which cause this interrupt are cleared. Note: Only accessible in device mode.
17:16	Reserved	Must be kept at reset value
15	EOPFIF	End of periodic frame interrupt flag When USB bus time in a frame reaches the value defined by EOPFT [1:0] bits in USBFS_DCFG register, USBFS sets this flag. Note: Only accessible in device mode.
14	ISOOPDIF	Isochronous OUT packet dropped interrupt flag USBFS set this bit if it receives an isochronous OUT packet but cannot save it into Rx FIFO because the FIFO doesn't have enough space. Note: Only accessible in device mode.
13	ENUMF	Enumeration finished USBFS sets this bit after the speed enumeration finishes. Read USBFS_DSTAT register to get the current device speed. Note: Only accessible in device mode.
12	RST	USB reset USBFS sets this bit when it detects a USB reset signal on bus. Note: Only accessible in device mode.
11	SP	USB suspend USBFS sets this bit when it detects that the USB bus is idle for 3 ms and enters suspend state. Note: Only accessible in device mode.
10	ESP	Early suspend USBFS sets this bit when it detects that the USB bus is idle for 3 ms. Note: Only accessible in device mode.
9:8	Reserved	Must be kept at reset value
7	GONAK	Global OUT NAK effective Write 1 to SGONAK bit in the USBFS_DCTL register and USBFS will set GONAK flag after the writing to SGONAK takes effect. Note: Only accessible in device mode.
6	GNPINAK	Global Non-Periodic IN NAK effective Write 1 to SGINAK bit in the USBFS_DCTL register and USBFS will set GNPINAK

		flag after the writing to SGINAK takes effect. Note: Only accessible in device mode.
5	NPTXFEIF	Non-Periodic Tx FIFO empty interrupt flag This interrupt is triggered when the non-periodic transmit FIFO is either half or completely empty. The threshold is determined by the non-periodic Tx FIFO empty level bit (TXFTH) in the USBFS_GAHBCS register. Note: Only accessible in host mode.
4	RXFNEIF	Rx FIFO non-empty interrupt flag USBFS sets this bit when there is at least one packet or status entry in the Rx FIFO. Note: Accessible in both host and device modes.
3	SOF	Start of frame Host Mode: USBFS sets this bit when it prepares to transmit a SOF or Keep-Alive on USB bus. Software can clear this bit by writing 1. Device Mode: USBFS sets this bit after it receives a SOF token. The application can read the Device Status register to get the current frame number. Software can clear this bit by writing 1. Note: Accessible in both host and device modes.
2	OTGIF	OTG interrupt flag USBFS sets this bit when the flags in USBFS_GOTGINTF register generate an interrupt. Software should read USBFS_GOTGINTF register to get the source of this interrupt. This bit is cleared after the flags in USBFS_GOTGINTF causing this interrupt are cleared. Note: Accessible in both host and device modes.
1	MFIF	Mode fault interrupt flag USBFS sets this bit when software operates host-only register in device mode, or operates device-mode in host mode. These fault operations won't take effect. Note: Accessible in both host and device modes.
0	COPM	Current operation mode 0: Device mode 1: Host mode Note: Accessible in both host and device modes.

Global interrupt enable register (USBFS_GINTEN)

Address offset: 0x0018
Reset value: 0x0000 0000

This register works with the global interrupt flag register (USBFS_GINTF) to interrupt the application. When an interrupt enable bit is disabled, the interrupt associated with that bit is not generated. However, the global Interrupt flag register bit corresponding to that interrupt is still set.

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

12	RSTIE	USB reset interrupt enable 0: Disable USB reset interrupt 1: Enable USB reset interrupt Note: Only accessible in device mode.
11	SPIE	USB suspend interrupt enable 0: Disable USB suspend interrupt 1: Enable USB suspend interrupt Note: Only accessible in device mode.
10	ESPIE	Early suspend interrupt enable 0: Disable early suspend interrupt 1: Enable early suspend interrupt Note: Only accessible in device mode.
9:8	Reserved	Must be kept at reset value
7	GONAKIE	Global OUT NAK effective interrupt enable 0: Disable global OUT NAK interrupt 1: Enable global OUT NAK interrupt Note: Only accessible in device mode.
6	GNPINAKIE	Global non-periodic IN NAK effective interrupt enable 0: Disable global non-periodic IN NAK effective interrupt 1: Enable global non-periodic IN NAK effective interrupt Note: Only accessible in device mode.
5	NPTXFEIE	Non-periodic Tx FIFO empty interrupt enable 0: Disable non-periodic Tx FIFO empty interrupt 1: Enable non-periodic Tx FIFO empty interrupt Note: Only accessible in Host mode.
4	RXFNEIE	Receive FIFO non-empty interrupt enable 0: Disable receive FIFO non-empty interrupt 1: Enable receive FIFO non-empty interrupt Note: Accessible in both device and host modes.
3	SOFIE	Start of frame interrupt enable 0: Disable start of frame interrupt 1: Enable start of frame interrupt Note: Accessible in both device and host modes.
2	OTGIE	OTG interrupt enable 0: Disable OTG interrupt 1: Enable OTG interrupt Note: Accessible in both device and host modes.
1	MFIE	Mode fault interrupt enable

		0: Disable mode fault interrupt 1: Enable mode fault interrupt Note: Accessible in both device and host modes.
0	Reserved	Must be kept at reset value

Global receive status read/receive status read and pop registers (USBFS_GRSTATR/USBFS_GRSTATP)

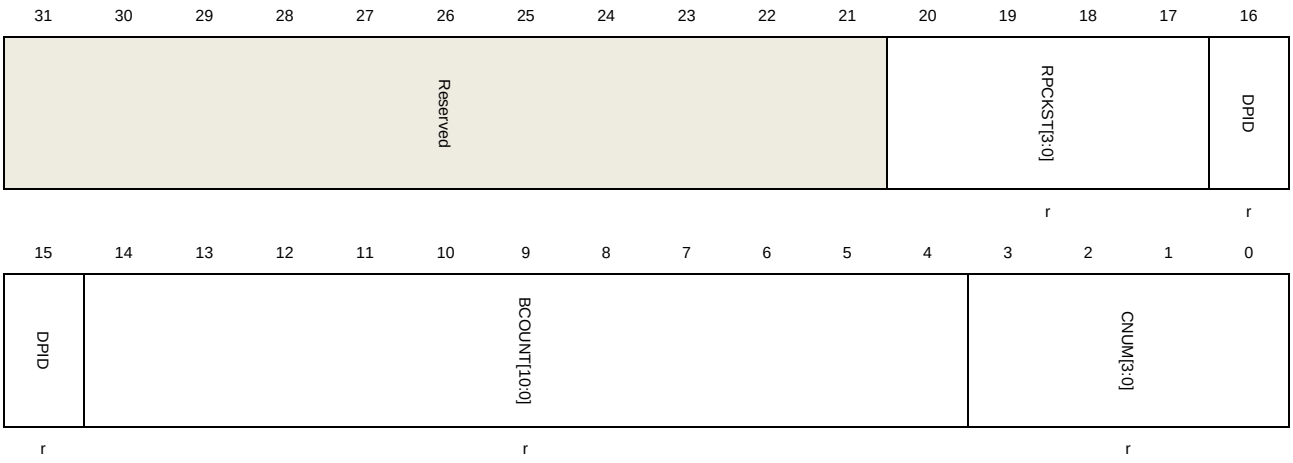
Address offset for Read: 0x001C
Address offset for Pop: 0x0020
Reset value: 0x0000 0000

A read to the receive status read register returns the entry of the top of the Rx FIFO. A read to the Receive status read and pop register additionally pops the top entry out of the Rx FIFO.

The entries in RxFIFO have different meanings in host and device modes. Software should only read this register after when Receive FIFO non-empty interrupt flag bit of the global interrupt flag register (RXFNEIF bit in USBFS_GINTF) is triggered.

This register has to be accessed by word (32-bit)

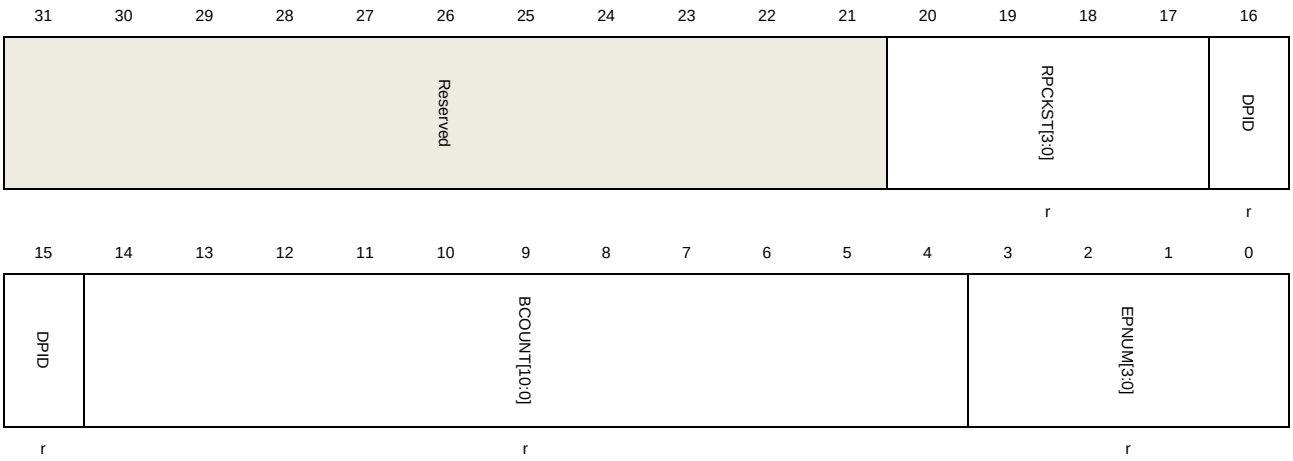
Host mode:



Bits	Fields	Descriptions
31:21	Reserved	Must be kept at reset value
20:17	RPCKST[3:0]	Received packet status 0010: IN data packet received 0011: IN transfer completed (generates an interrupt if poped) 0101: Data toggle error (generates an interrupt if poped) 0111: Channel halted (generates an interrupt if poped) Others: Reserved
16:15	DPID[1:0]	Data PID

		The Data PID of the received packet 00: DATA0 10: DATA1 Others: Reserved
14:4	BCOUNT[10:0]	Byte count The byte count of the received IN data packet.
3:0	CNUM[3:0]	Channel number The channel number to which the current received packet belongs.

Device mode:



Bits	Fields	Descriptions
31:21	Reserved	Must be kept at reset value
20:17	RPCKST[3:0]	Received packet status 0001: Global OUT NAK (generates an interrupt) 0010: OUT data packet received 0011: OUT transfer completed (generates an interrupt) 0100: SETUP transaction completed (generates an interrupt) 0110: SETUP data packet received Others: Reserved
16:15	DPID[1:0]	Data PID The Data PID of the received OUT data packet 00: DATA0 10: DATA1 Others: Reserved
14:4	BCOUNT[10:0]	Byte count The byte count of the received data packet.
3:0	EPNUM[3:0]	Endpoint number

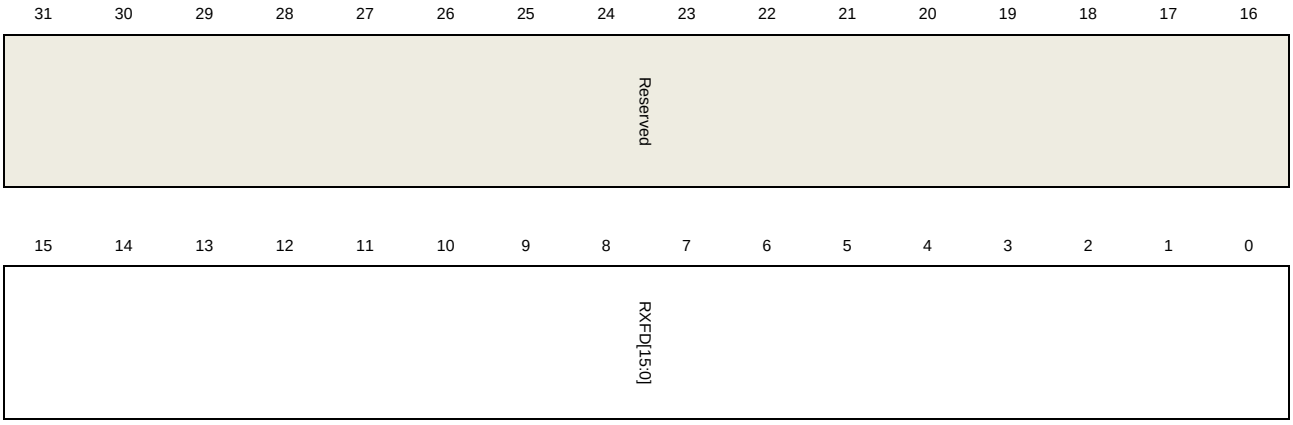
The endpoint number to which the current received packet belongs.

Global receive FIFO length register (USBFS_GRFLEN)

Address offset: 0x024

Reset value: 0x0000 0200

This register has to be accessed by word (32-bit)



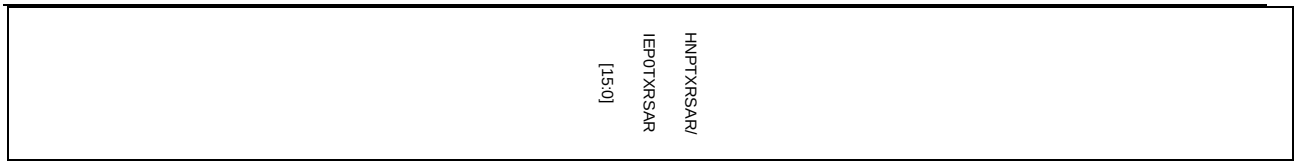
Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15:0	RXFD[15:0]	Rx FIFO depth In terms of 32-bit words. 1≤RXFD≤1024

Host non-periodic transmit FIFO length register /Device IN endpoint 0 transmit FIFO length (USBFS_HNPTFLEN _DIEP0TFLEN)

Address offset: 0x028

Reset value: 0x0200 0200

This register has to be accessed by word (32-bit)



Host Mode:

Bits	Fields	Descriptions
31:16	HNPTXFD[15:0]	Host Non-periodic Tx FIFO depth In terms of 32-bit words. 1≤HNPTXFD≤1024
15:0	HNPTXRSAR[15:0]	Host Non-periodic Tx RAM start address The start address for non-periodic transmit FIFO RAM is in term of 32-bit words.

Device Mode:

Bits	Fields	Descriptions
31:16	IEP0TXFD[15:0]	IN Endpoint 0 Tx FIFO depth In terms of 32-bit words. 16≤IEP0TXFD≤140
15:0	IEP0TXRSAR[15:0]	IN Endpoint 0 TX RAM start address The start address for endpoint0 transmit FIFO RAM is in term of 32-bit words.

Host non-periodic transmit FIFO/queue status register (USBFS_HNPTFQSTAT)

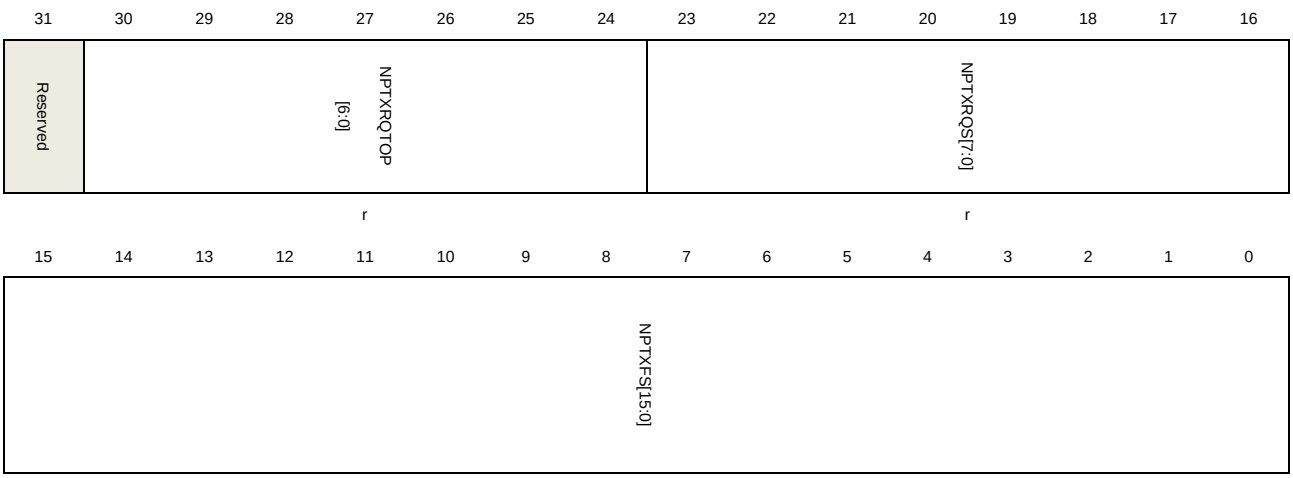
Address offset: 0x002C

Reset value: 0x0008 0200

This register reports the current status of the non-periodic Tx FIFO and request queue. The request queue holds IN, OUT or other request entries in host mode.

Note: In Device mode, this register is not valid.

This register has to be accessed by word (32-bit)



r

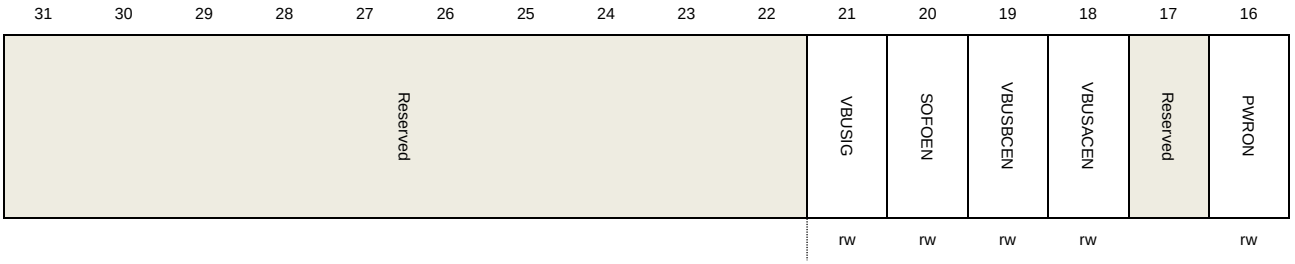
Bits	Fields	Descriptions
31	Reserved	Must be kept at reset value
30:24	NPTXRQTOP[6:0]	Top entry of the non-periodic Tx request queue Entry in the non-periodic transmit request queue. Bits 30:27: Channel number Bits 26:25: – 00: IN/OUT token – 01: Zero-length OUT packet – 11: Channel halt request Bit 24: Terminate Flag, indicating last entry for selected channel.
23:16	NPTXRQS[7:0]	Non-periodic Tx request queue space The remaining space of the non-periodic transmit request queue. 0: Request queue is Full 1: 1 entry 2: 2 entries … n: n entries (0≤n≤8) Others: Reserved
15:0	NPTXFS[15:0]	Non-periodic Tx FIFO space The remaining space of the non-periodic transmit FIFO. In terms of 32-bit words. 0: Non-periodic Tx FIFO is full 1: 1 word 2: 2 words n: n words (0≤n≤NPTXFD) Others: Reserved

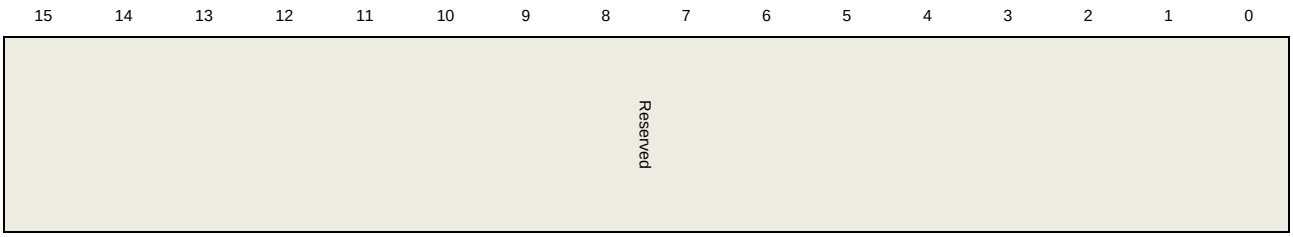
Global core configuration register (USBFS_GCCFG)

Address offset: 0x0038

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)





Bits	Fields	Descriptions
31:22	Reserved	Must be kept at reset value
21	VBUSIG	VBUS ignored When this bit is set, USBFS doesn't monitor the voltage on VBUS pin and always consider VBUS voltage as valid both in host mode and in device mode, then free the VBUS pin for other usage. 0: VBUS is not ignored. 1: VBUS is ignored and always consider VBUS voltage as valid.
20	SOFOEN	SOF output enable 0: SOF pulse output disabled. 1: SOF pulse output enabled.
19	VBUSBCEN	The V_{BUS} B-device Comparer enable 0: V_{BUS} B-device comparer disabled 1: V_{BUS} B-device comparer enabled
18	VBUSACEN	The VBUS A-device Comparer enable 0: V_{BUS} A-device comparer disabled 1: V_{BUS} A-device comparer enabled
17	Reserved	Must be kept at reset value
16	PWRON	Power on This bit is the power switch for the internal embedded Full-Speed PHY. 0: Embedded Full-Speed PHY power off. 1: Embedded Full-Speed PHY power on.
15:0	Reserved	Must be kept at reset value.

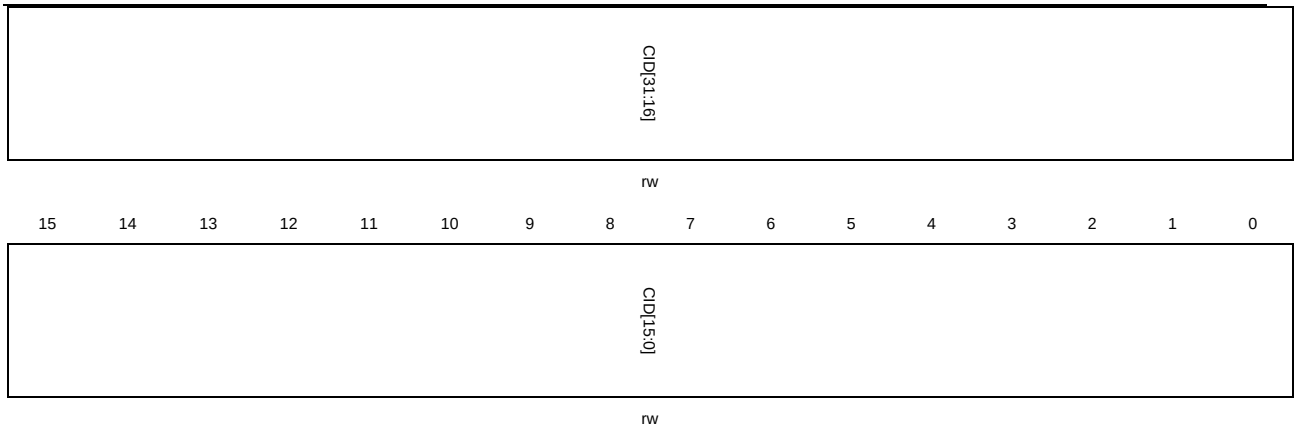
Core ID register (USBFS_CID)

Address offset: 0x003C

Reset value: 0x0000 1000

This register contains the Product ID.

This register has to be accessed by word (32-bit)



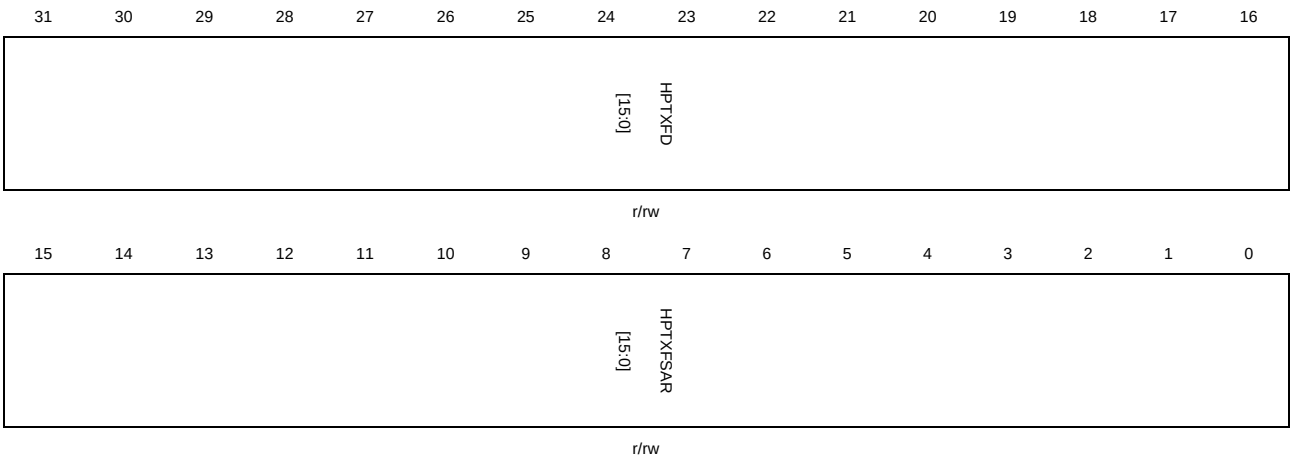
Bits	Fields	Descriptions
31:0	CID[31:0]	Core ID Software can write or read this field and uses this field as a unique ID for its application

Host periodic transmit FIFO length register (USBFS_HPTFLEN)

Address offset: 0x0100

Reset value: 0x0200 0600

This register has to be accessed by word 32-bit)

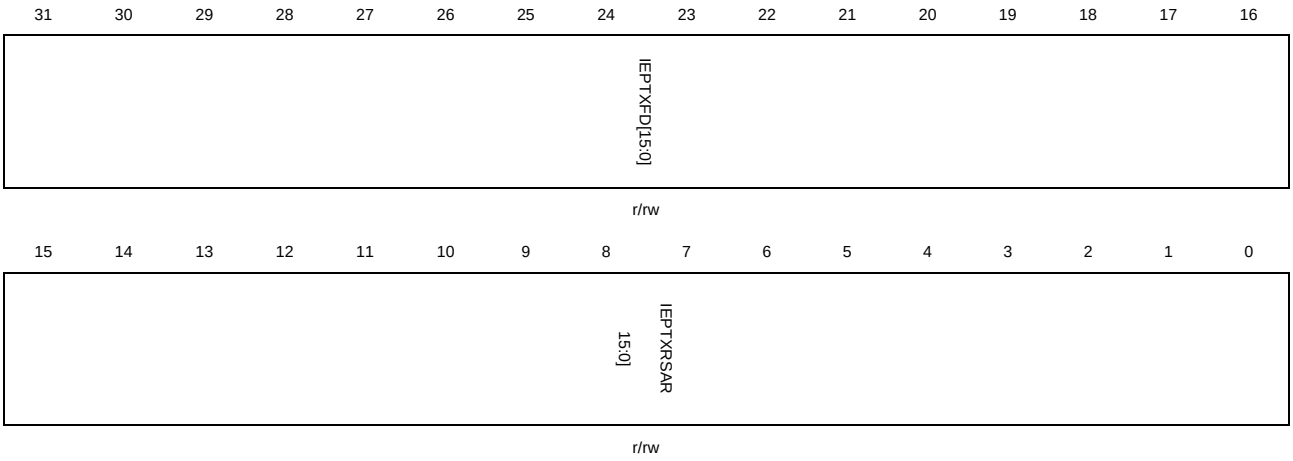


Bits	Fields	Descriptions
31:16	HPTXFD[15:0]	Host Periodic Tx FIFO depth In terms of 32-bit words. 1≤HPTXFD≤1024
15:0	HPTXFSAR[15:0]	Host periodic Tx FIFO RAM start address The start address for host periodic transmit FIFO RAM is in term of 32-bit words.

Device IN endpoint transmit FIFO length register (USBFS_DIEPxTFLEN) (x = 1..3, where x is the FIFO_number)

Address offset: 0x0104 + (FIFO_number – 1) × 0x04
Reset value: 0x0200 0400

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:16	IEPTXFD[15:0]	IN endpoint Tx FIFO depth In terms of 32-bit words. 1≤HPTXFD≤1024
15:0	IEPTXRSAR[15:0]	IN endpoint FIFO Tx RAM start address The start address for IN endpoint transmit FIFOx is in term of 32-bit words.

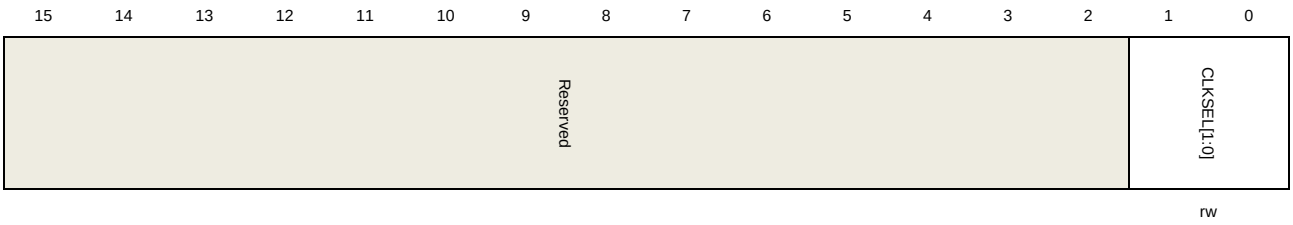
21.7.2. Host control and status registers

Host control register (USBFS_HCTL)

Address offset: 0x0400
Reset value: 0x0000 0000

This register configures the core after power on in host mode. Do not modify it after host initialization.

This register has to be accessed by word (32-bit)



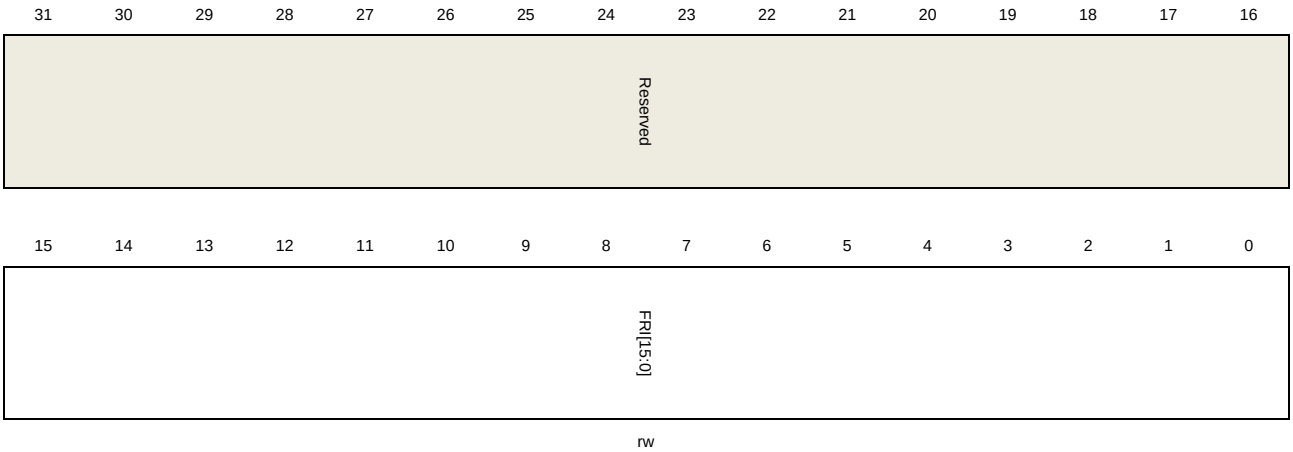
Bits	Fields	Descriptions
31:2	Reserved	Must be kept at reset value
1:0	CLKSEL[1:0]	Clock select for usbclock. 01: 48MHz clock others: reserved

Host frame interval register (USBFS_HFT)

Address offset: 0x0404
Reset value: 0x0000 BB80

This register sets the frame interval for the current enumerating speed when USBFS controller is enumerating.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15:0	FRI[15:0]	Frame interval This value describes the frame time in terms of PHY clocks. Each time when port is enabled after a port reset operation, USBFS use a proper value according to the current speed, and software can write to this field to change the value. This value should be calculated using the frequency described below: Full-Speed: 48MHz

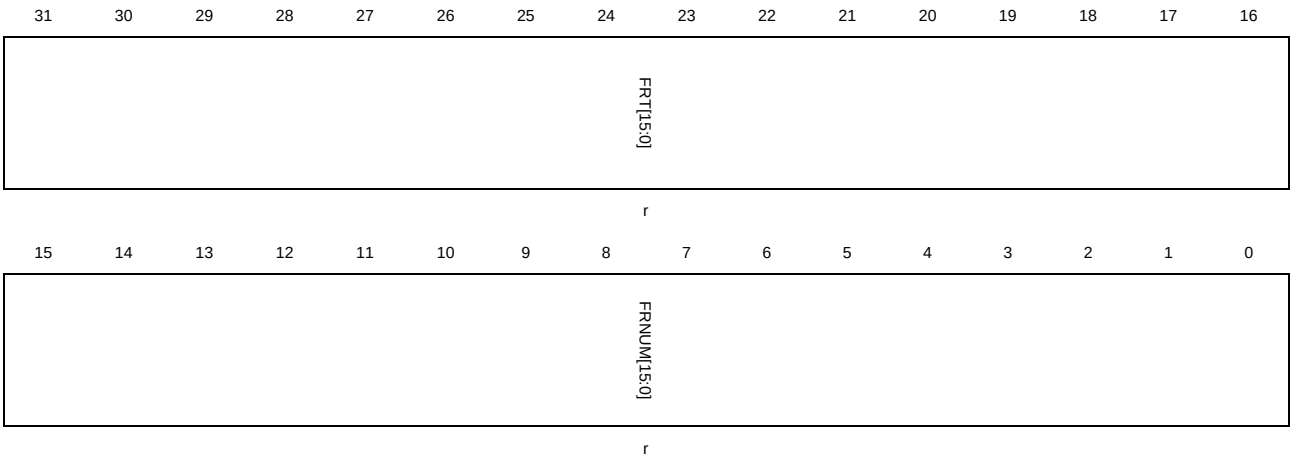
Low-Speed: 6MHz

Host frame information remaining register (USBFS_HFINFR)

Address offset: 0x408

Reset value: 0xBB80 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:16	FRT[15:0]	Frame remaining time This field reports the remaining time of current frame in terms of PHY clocks.
15:0	FRNUM[15:0]	Frame number This field reports the frame number of current frame and returns to 0 after it reaches 0x3FFF.

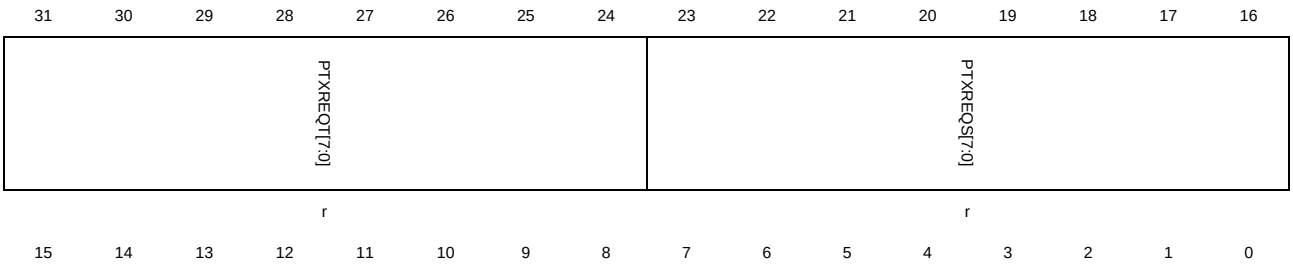
Host periodic transmit FIFO/queue status register (USBFS_HPTFQSTAT)

Address offset: 0x0410

Reset value: 0x0008 0200

This register reports the current status of the host periodic Tx FIFO and request queue. The request queue holds IN, OUT or other request entries in host mode.

This register has to be accessed by word (32-bit)



PTXFS[15:0]
r

Bits	Fields	Descriptions
31:24	PTXREQT[7:0]	Top entry of the periodic Tx request queue Entry in the periodic transmit request queue. Bits 30:27: Channel Number Bits 26:25: 00: IN/OUT token 01: Zero-length OUT packet 11: Channel halt request Bit 24: Terminate Flag, indicating last entry for selected channel.
23:16	PTXREQS[7:0]	Periodic Tx request queue space The remaining space of the periodic transmit request queue. 0: Request queue is Full 1: 1 entry 2: 2 entries … n: n entries (0≤n≤8) Others: Reserved
15:0	PTXFS[15:0]	Periodic Tx FIFO space The remaining space of the periodic transmit FIFO. In terms of 32-bit words. 0: periodic Tx FIFO is full 1: 1 word 2: 2 words n: n words (0≤n≤PTXFD) Others: Reserved

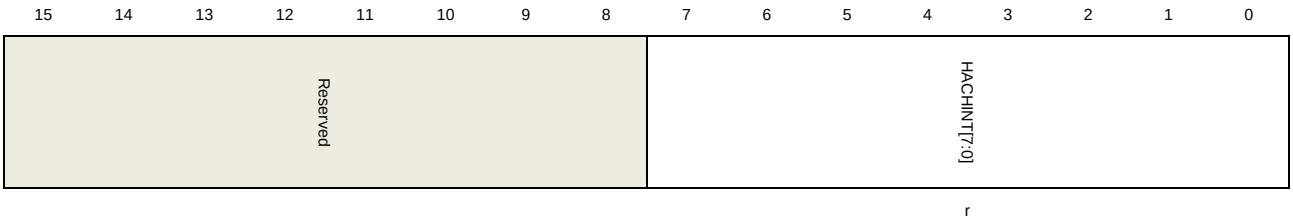
Host all channels interrupt register (USBFS_HACHINT)

Address offset: 0x0414
Reset value: 0x0000 0000

When a channel interrupt is triggered, USBFS set corresponding bit in this register and software should read this register to know which channel is asserting interrupts.

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16



Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value
7:0	HACHINT[7:0]	Host all channel interrupts Each bit represents a channel: Bit 0 for channel 0, bit 7 for channel 7.

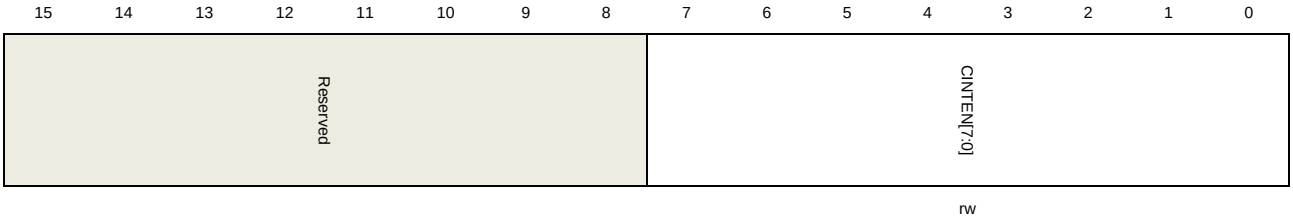
Host all channels interrupt enable register (USBFS_HACHINTEN)

Address offset: 0x0418

Reset value: 0x0000 0000

This register can be used by software to enable or disable a channel's interrupt. Only the channel whose corresponding bit in this register is set is able to cause the channel interrupt flag HCIF in USBFS_GINTF register.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value
7:0	CINTEN[7:0]	Channel interrupt enable 0: Disable channel-n interrupt

1: Enable channel-n interrupt

Each bit represents a channel: Bit 0 for channel 0, bit 7 for channel 7.

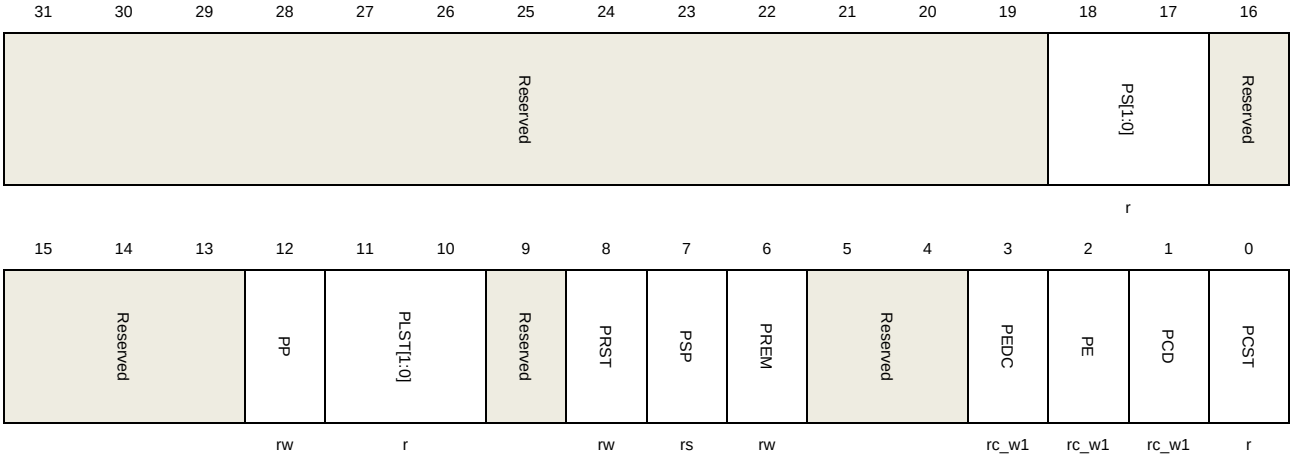
Host port control and status register (USBFS_HPCS)

Address offset: 0x0440

Reset value: 0x0000 0000

This register controls the port's behavior and also has some flags which report the status of the port. The HPIF flag in USBFS_GINTF register will be triggered if one of these flags in this register is set by USBFS: PRST, PEDC and PCD.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:19	Reserved	Must be kept at reset value
18:17	PS[1:0]	Port speed Report the enumerated speed of the device attached to this port. 01: Full speed 10: Low speed Others: Reserved
16:13	Reserved	Must be kept at reset value
12	PP	Port power This bit should be set before a port is used. Because USBFS doesn't have power supply ability, it only uses this bit to know whether the port is in powered state. Software should ensure the true power supply on VBUS before setting this bit. 0: Port is powered off 1: Port is powered on
11:10	PLST[1:0]	Port line status Report the current state of USB data lines

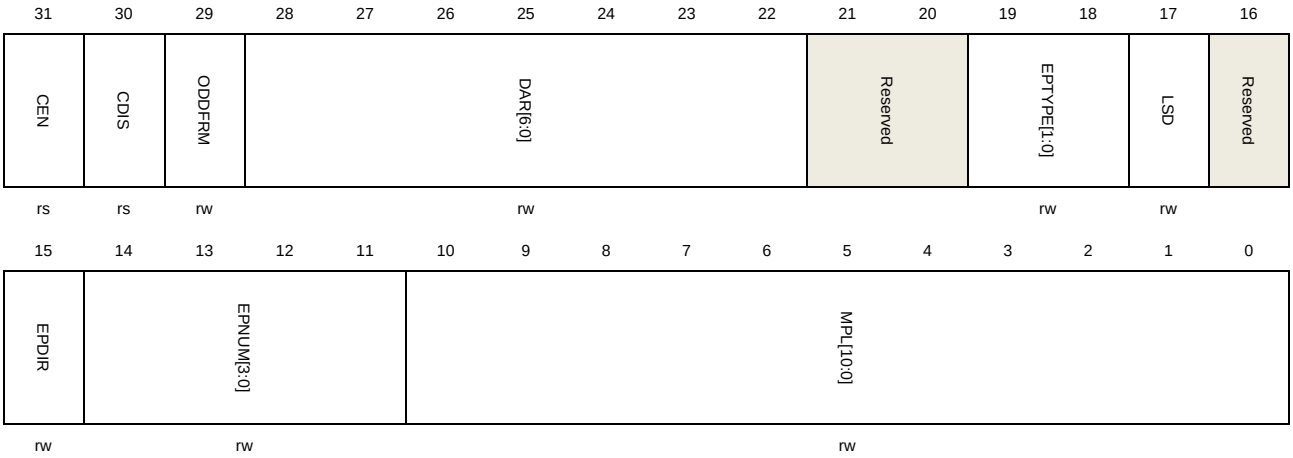
		Bit 10: State of DP line Bit 11: State of DM line
9	Reserved	Must be kept at reset value
8	PRST	Port reset Application sets this bit to start a reset signal on USB port. Application should clear this bit when it wants to stop the reset signal. 0: Port is not in reset state 1: Port is in reset state
7	PSP	Port suspend Application sets this bit to put port into suspend state. When this bit is set the port stops sending SOF tokens. This bit can only be cleared by the following operations: PRST bit in this register is set by application PREM bit in this register is set A remote wakeup signal is detected A device disconnect is detected 0: Port is not in suspend state 1: Port is in suspend state
6	PREM	Port resume Application sets this bit to start a resume signal on USB port. Application should clear this bit when it wants to stop the resume signal. 0: No resume driven 1: Resume driven
5:4	Reserved	Must be kept at reset value
3	PEDC	Port enable/disable change Set by the core when the status of the Port enable bit 2 in this register changes.
2	PE	Port Enable This bit is automatically set by USBFS after a USB reset signal finishes and cannot be set by software. This bit is cleared by the following events: A disconnect condition Software clearing this bit 0: Port disabled 1: Port enabled
1	PCD	Port connect detected Set by USBFS when a device connection is detected. This bit can be cleared by writing 1 to this bit.
0	PCST	Port connect status 0: Device is not connected to the port

1: Device is connected to the port

Host channel-x control register (USBFS_HCHxCTL) (x = 0..7 where x = channel_number)

Address offset: 0x0500 + (channel_number × 0x20)
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31	CEN	Channel enable Set by the application and cleared by USBFS. 0: Channel disabled 1: Channel enabled Software should following the operation guide to disable or enable a channel.
30	CDIS	Channel disable Software can set this bit to disable the channel from processing transactions. Software should follow the operation guide to disable or enable a channel.
29	ODDFRM	Odd frame For periodic transfers (interrupt or isochronous transfer), this bit controls that whether in an odd frame or even frame this channel's transaction is desired to be processed. 0: Even frame 1: Odd frame
28:22	DAR[6:0]	Device address The address of the USB device that this channel wants to communicate with.
21:20	Reserved	Must be kept at reset value
19:18	EPTYPE[1:0]	Endpoint type

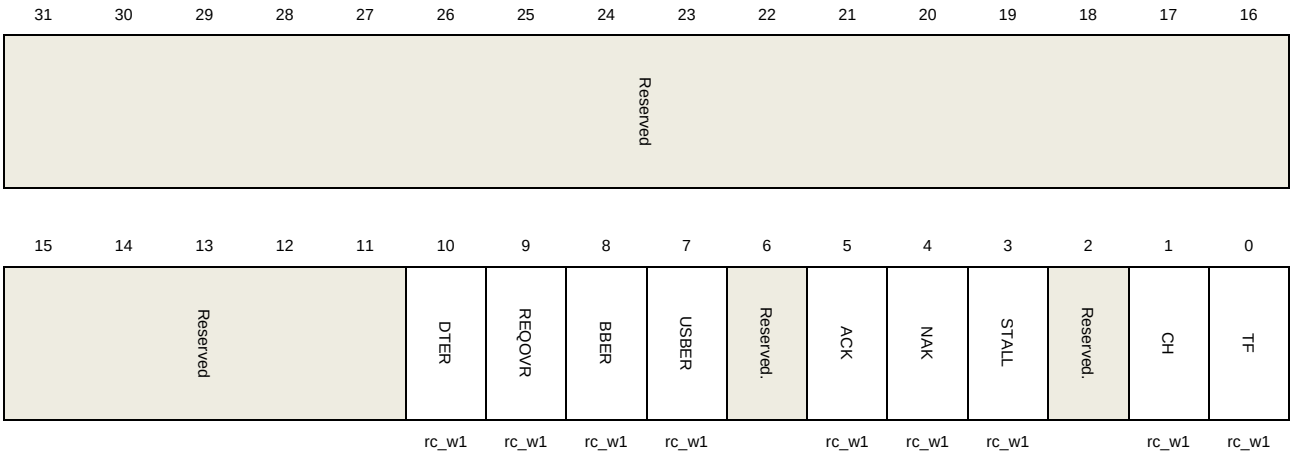
		The transfer type of the endpoint that this channel wants to communicate with. 00: Control 01: Isochronous 10: Bulk 11: Interrupt
17	LSD	Low-Speed device The device that this channel wants to communicate with is a Low-Speed Device.
16	Reserved	Must be kept at reset value
15	EPDIR	Endpoint direction The transfer direction of the endpoint that this channel wants to communicate with. 0: OUT 1: IN
14:11	EPNUM[3:0]	Endpoint number The number of the endpoint that this channel wants to communicate with.
10:0	MPL[10:0]	Maximum packet length The target endpoint's maximum packet length.

Host channel-x interrupt flag register (USBFS_HCHxINTF) (x = 0..7 where x = channel number)

Address offset: 0x0508 + (channel_number × 0x20)
Reset value: 0x0000 0000

This register contains the status and events of a channel, when software get a channel interrupt, it should read this register for the respective channel to know the source of the interrupt. The flag bits in this register are all set by hardware and cleared by writing 1.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:11	Reserved	Must be kept at reset value
10	DTER	Data toggle error The IN transaction gets a data packet but the PID of this packet doesn't match DPID [1:0] bits in USBFS_HCHxLEN register.
9	REQOVR	Request queue overrun The periodic request queue is full when software starts new transfers.
8	BBER	Babble error A babble condition occurs on USB bus. A typical reason for babble condition is that a device sends a data packet and the packet length exceeds the endpoint's maximum packet length.
7	USBER	USB Bus Error The USB error flag is set when the following conditions occurs during receiving a packet: A received packet has a wrong CRC field A stuff error detected on USB bus Timeout when waiting for a response packet
6	Reserved	Must be kept at reset value
5	ACK	ACK An ACK response is received or transmitted
4	NAK	NAK A NAK response is received.
3	STALL	STALL A STALL response is received.
2	Reserved	Must be kept at reset value
1	CH	Channel halted This channel is disabled by a request, and it will not response to other requests during the request processing.
0	TF	Transfer finished All the transactions of this channel finish successfully, and no error occurs. For IN channel, this flag will be triggered after PCNT bits in USBFS_HCHxLEN register reach zero. For OUT channel, this flag will be triggered when software reads and pops a TF status entry from the RxFIFO.

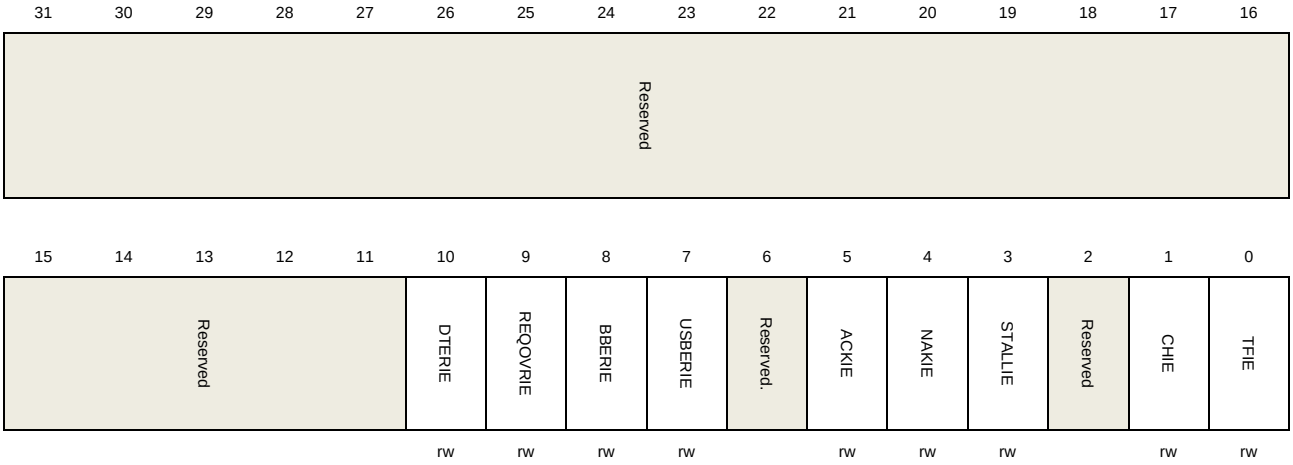
Host channel-x interrupt enable register (USBFS_HCHxINTEN) (x = 0..7, where x = channel number)

Address offset: 0x050C + (channel_number × 0x20)

Reset value: 0x0000 0000

This register contains the interrupt enable bits for the flags in USBFS_HCHxINTF register. If a bit in this register is set by software, the corresponding bit in USBFS_HCHxINTF register is able to trigger a channel interrupt. The bits in this register are set and cleared by software.

This register has to be accessed by word (32-bit)



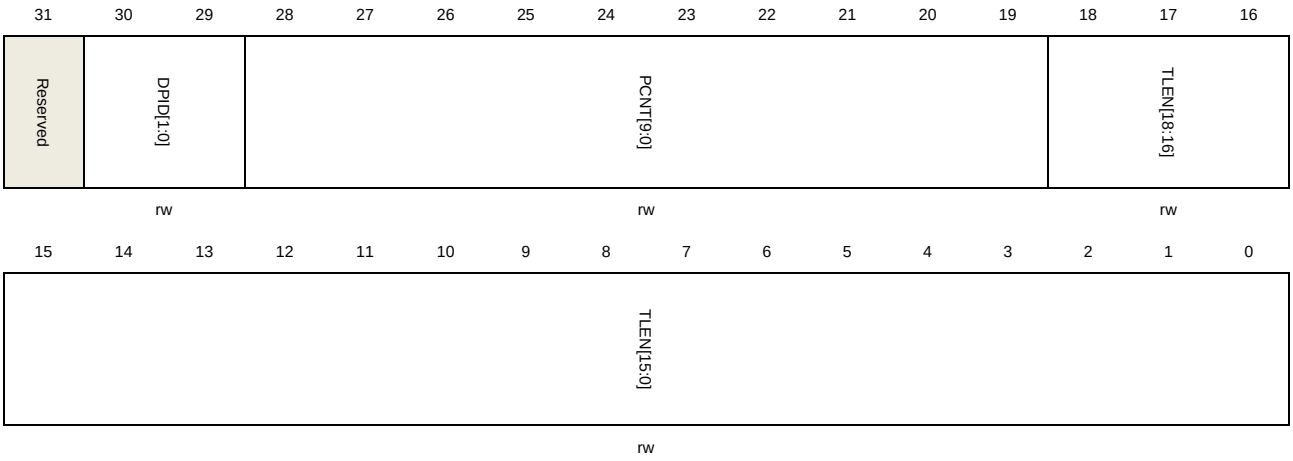
Bits	Fields	Descriptions
31:11	Reserved	Must be kept at reset value
10	DTERIE	Data toggle error interrupt enable 0: Disable data toggle error interrupt 1: Enable data toggle error interrupt
9	REQOVRIE	Request queue overrun interrupt enable 0: Disable request queue overrun interrupt 1: Enable request queue overrun interrupt
8	BBERIE	Babble error interrupt enable 0: Disable babble error interrupt 1: Enable babble error interrupt
7	USBERIE	USB bus error interrupt enable 0: Disable USB bus error interrupt 1: Enable USB bus error interrupt
6	Reserved	Must be kept at reset value
5	ACKIE	ACK interrupt enable 0: Disable ACK interrupt 1: Enable ACK interrupt
4	NAKIE	NAK interrupt enable 0: Disable NAK interrupt

		1: Enable NAK interrupt
3	STALLIE	STALL interrupt enable 0: Disable STALL interrupt 1: Enable STALL interrupt
2	Reserved	Must be kept at reset value
1	CHIE	Channel halted interrupt enable 0: Disable channel halted interrupt 1: Enable channel halted interrupt
0	TFIE	Transfer finished interrupt enable 0: Disable transfer finished interrupt 1: Enable transfer finished interrupt

Host channel-x transfer length register (USBFS_HCHxLEN) (x = 0..7, where x = channel number)

Address offset: 0x0510 + (channel_number × 0x20)
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31	Reserved	Must be kept at reset value
30:29	DPID[1:0]	Data PID Software should write this field before the transfer starts. For OUT transfers, this field controls the Data PID of the first transmitted packet. For IN transfers, this field controls the expected Data PID of the first received packet, and DTERR will be triggered if the Data PID doesn't match. After the transfer starts, USBFS changes and toggles this field automatically following the USB protocol. 00: DATA0

		10: DATA1 11: SETUP (For control transfer only) 01: Reserved
28:19	PCNT[9:0]	Packet count The number of data packets desired to be transmitted (OUT) or received (IN) in a transfer. Software should program this field before the channel is enabled. After the transfer starts, this field is decreased automatically by USBFS after each successful data packet transmission.
18:0	TLEN[18:0]	Transfer length The total data byte number of a transfer. For OUT transfers, this field is the total data bytes of all the data packets desired to be transmitted in an OUT transfer. Software should program this field before the channel is enabled. When software successfully writes a packet into the channel's data TxFIFO, this field is decreased by the byte size of the packet. For IN transfer each time software reads out a packet from the RxFIFO, this field is decreased by the byte size of the packet.

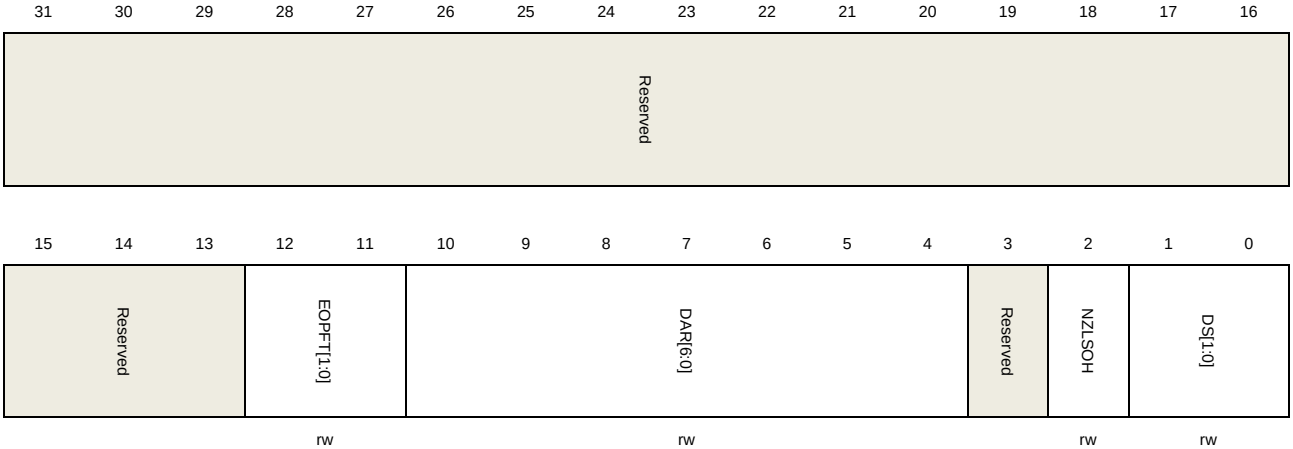
21.7.3. Device control and status registers

Device configuration register (USBFS_DCFG)

Address offset: 0x0800
Reset value: 0x0000 0000

This register configures the core in device mode after power on or after certain control commands or enumeration. Do not change this register after device initialization.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions

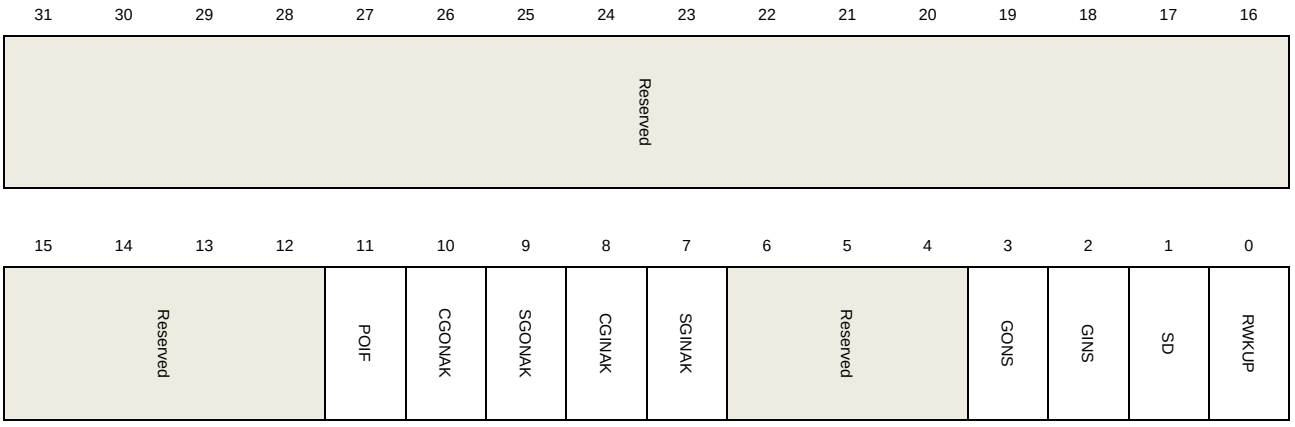
31:13	Reserved	Must be kept at reset value
12:11	EOPFT[1:0]	End of periodic frame time This field defines the percentage time point in a frame that the end of periodic frame (EOPF) flag should be triggered. 00: 80% of the frame time 01: 85% of the frame time 10: 90% of the frame time 11: 95% of the frame time
10:4	DAR[6:0]	Device address This field defines the USB device's address. USBFS uses this field to match with the incoming token's device address field. Software should program this field after receiving a Set Address command from USB host.
3	Reserved	Must be kept at reset value
2	NZLSOH	Non-zero-length status OUT handshake When a USB device receives a non-zero-length data packet during status OUT stage, this field controls that either USBFS should receive this packet or reject this packet with a STALL handshake. 0: Treat this packet as a normal packet and response according to the status of NAKS and STALL bits in USBFS_DOEPxCTL register. 1: Send a STALL handshake and don't save the received OUT packet.
1:0	DS[1:0]	Device speed This field controls the device speed when the device connected to a host. 11: Full speed Others: Reserved

Device control register (USBFS_DCTL)

Address offset: 0x0804

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



rw w w w w r r rw rw

Bits	Fields	Descriptions
31:12	Reserved	Must be kept at reset value
11	POIF	Power-on initialization finished Software should set this bit to notify USBFS that the registers are initialized after waking up from power down state.
10	CGONAK	Clear global OUT NAK Software sets this bit to clear GONS bit in this register.
9	SGONAK	Set global OUT NAK Software sets this bit to set GONS bit in this register. When GONS bit is zero, setting this bit will also cause GONAK flag in USBFS_GINTF register triggered after a while. Software should clear the GONAK flag before writing this bit again.
8	CGINAK	Clear global IN NAK Software sets this bit to clear GINS bit in this register.
7	SGINAK	Set global IN NAK Software sets this bit to set GINS bit in this register. When GINS bit is zero, setting this bit will also cause GINAK flag in USBFS_GINTF register triggered after a while. Software should clear the GINAK flag before writing this bit again.
6:4	Reserved	Must be kept at reset value
3	GONS	Global OUT NAK status 0: The handshake that USBFS response to OUT transaction packet and whether to save the OUT data packet are decided by Rx FIFO status, endpoint's NAK and STALL bits. 1: USHBS always responses to OUT transaction with NAK handshake and doesn't save the incoming OUT data packet.
2	GINS	Global IN NAK status 0: The response to IN transaction is decided by Tx FIFO status, endpoint's NAK and STALL bits. 1: USBFS always responses to IN transaction with a NAK handshake.
1	SD	Soft disconnect Software can use this bit to generate a soft disconnect condition on USB bus. After this bit is set, USBFS switches off the pull up resistor on DP line. This will cause the host to detect a device disconnect. 0: No soft disconnect generated. 1: Generate a soft disconnection.

0	RWKUP	Remote wakeup In suspend state, software can use this bit to generate a Remote wake up signal to inform host that it should resume the USB bus. 0: No remote wakeup signal generated. 1: Generate remote wakeup signal.

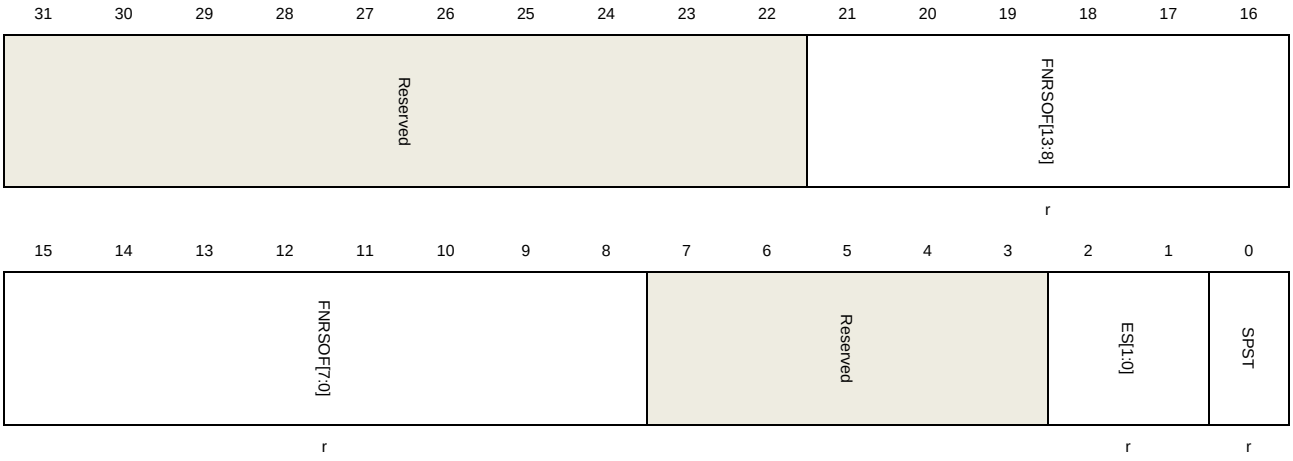
Device status register (USBFS_DSTAT)

Address offset: 0x0808

Reset value: 0x0000 0000

This register contains status and information of the USBFS in device mode.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:22	Reserved	Must be kept at reset value
21:8	FNRSOF[13:0]	The frame number of the received SOF. USBFS always update this field after receiving a SOF token
7:3	Reserved	Must be kept at reset value
2:1	ES[1:0]	Enumerated speed This field reports the enumerated device speed. Read this field after the ENUMF flag in USBFS_GINTF register is triggered. 11: Full speed Others: reserved
0	SPST	Suspend status This bit reports whether device is in suspend state. 0: Device is not in suspend state. 1: Device is in suspend state.

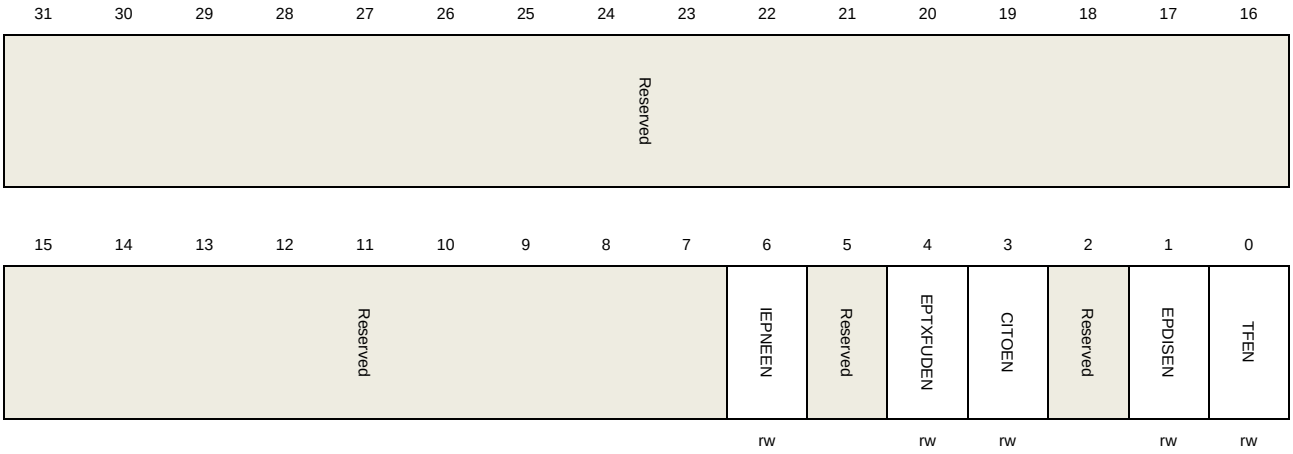
Device IN endpoint common interrupt enable register (USBFS_DIEPINTEN)

Address offset: 0x810

Reset value: 0x0000 0000

This register contains the interrupt enable bits for the flags in USBFS_DIEPxINTF register. If a bit in this register is set by software, the corresponding bit in USBFS_DIEPxINTF register is able to trigger an endpoint interrupt in USBFS_DAEPINT register. The bits in this register are set and cleared by software.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:7	Reserved	Must be kept at reset value
6	IEPNEEN	IN endpoint NAK effective interrupt enable bit 0: Disable IN endpoint NAK effective interrupt 1: Enable IN endpoint NAK effective interrupt
5	Reserved	Must be kept at reset value
4	EPTXFUDEN	Endpoint Tx FIFO underrun interrupt enable bit 0: Disable endpoint Tx FIFO underrun interrupt 1: Enable endpoint Tx FIFO underrun interrupt
3	CITOEN	Control IN timeout interrupt enable bit 0: Disable control IN timeout interrupt 1: Enable control In timeout interrupt
2	Reserved	Must be kept at reset value
1	EPDISEN	Endpoint disabled interrupt enable bit 0: Disable endpoint disabled interrupt 1: Enable endpoint disabled interrupt
0	TFEN	Transfer finished interrupt enable bit

0: Disable transfer finished interrupt

1: Enable transfer finished interrupt

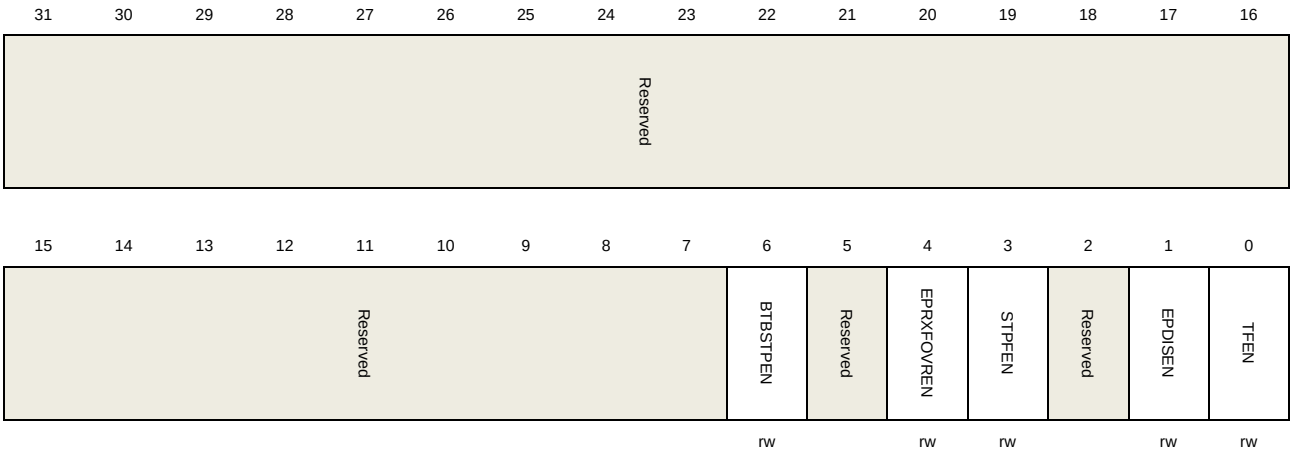
Device OUT endpoint common interrupt enable register (USBFS_DOEPINTEN)

Address offset: 0x0814

Reset value: 0x0000 0000

This register contains the interrupt enable bits for the flags in USBFS_DOEPxINTF register. If a bit in this register is set by software, the corresponding bit in USBFS_DOEPxINTF register is able to trigger an endpoint interrupt in USBFS_DAEPINT register. The bits in this register are set and cleared by software.

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:7	Reserved	Must be kept at reset value
6	BTBSTPEN	Back-to-back SETUP packets (Only for control OUT endpoint) interrupt enable bit 0: Disable back-to-back SETUP packets interrupt 1: Enable back-to-back SETUP packets interrupt
5	Reserved	Must be kept at reset value
4	EPRXFOVREN	Endpoint Rx FIFO overrun interrupt enable bit 0: Disable endpoint Rx FIFO overrun interrupt 1: Enable endpoint Rx FIFO overrun interrupt
3	STPFEN	SETUP phase finished (Only for control OUT endpoint) interrupt enable bit 0: Disable SETUP phase finished interrupt 1: Enable SETUP phase finished interrupt
2	Reserved	Must be kept at reset value

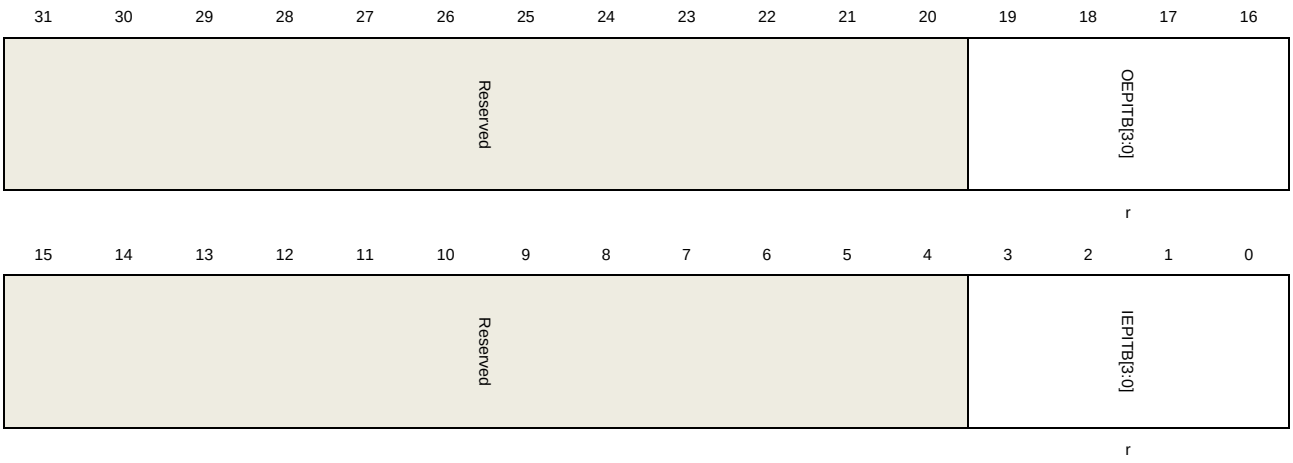
1	EPDISEN	Endpoint disabled interrupt enable bit 0: Disable endpoint disabled interrupt 1: Enable endpoint disabled interrupt
0	TFEN	Transfer finished interrupt enable bit 0: Disable transfer finished interrupt 1: Enable transfer finished interrupt

Device all endpoints interrupt register (USBFS_DAEPINT)

Address offset: 0x0818
Reset value: 0x0000 0000

When an endpoint interrupt is triggered, USBFS sets corresponding bit in this register and software should read this register to know which endpoint is asserting an interrupt.

This register has to be accessed by word (32-bit)



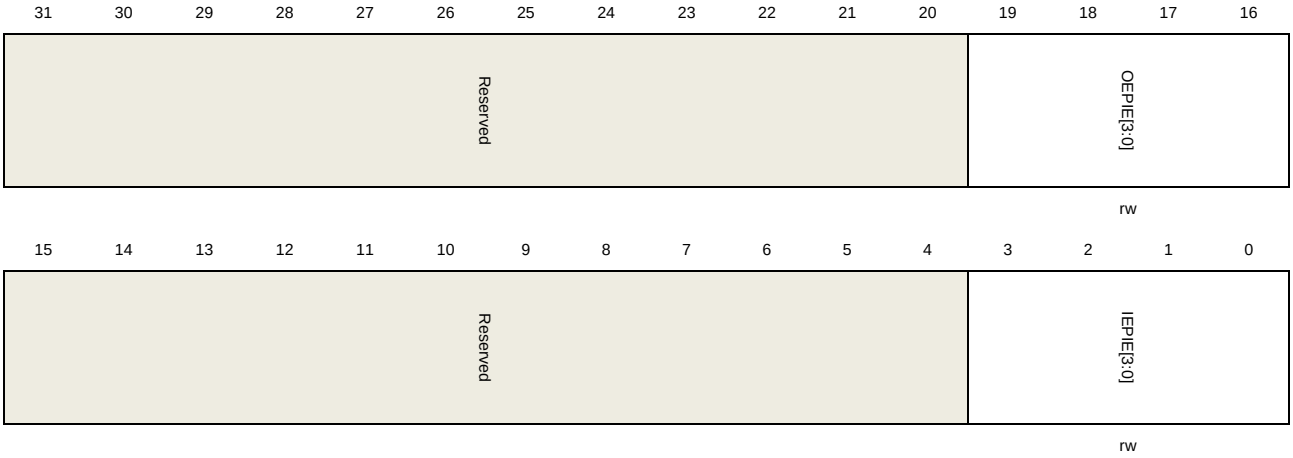
Bits	Fields	Descriptions
31:20	Reserved	Must be kept at reset value
19:16	OEPITB[3:0]	Device all OUT endpoint interrupt bits Each bit represents an OUT endpoint: Bit 16 for OUT endpoint 0, bit 19 for OUT endpoint 3.
15:4	Reserved	Must be kept at reset value
3:0	IEPITB[3:0]	Device all IN endpoint interrupt bits Each bit represents an IN endpoint: Bit 0 for IN endpoint 0, bit 3 for IN endpoint 3.

Device all endpoints interrupt enable register (USBFS_DAEPINTEN)

Address offset: 0x081C
Reset value: 0x0000 0000

This register can be used by software to enable or disable an endpoint's interrupt. Only the endpoint whose corresponding bit in this register is set is able to cause the endpoint interrupt flag OEPIF or IEPIF in USBFS_GINTF register.

This register has to be accessed by word (32-bit)



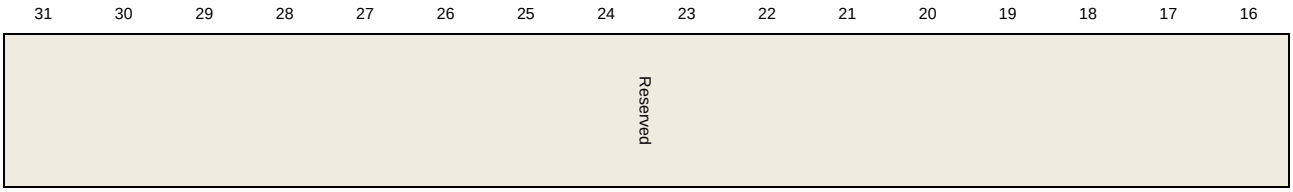
Bits	Fields	Descriptions
31:20	Reserved	Must be kept at reset value
19:16	OEPIE[3:0]	Out endpoint interrupt enable 0: Disable OUT endpoint-n interrupt 1: Enable OUT endpoint-n interrupt Each bit represents an OUT endpoint: Bit 16 for OUT endpoint 0, bit 19 for OUT endpoint 3.
15:4	Reserved	Must be kept at reset value
3:0	IEPIE[3:0]	IN endpoint interrupt enable bits 0: Disable IN endpoint-n interrupt 1: Enable IN endpoint-n interrupt Each bit represents an IN endpoint: Bit 0 for IN endpoint 0, bit 3 for IN endpoint 3.

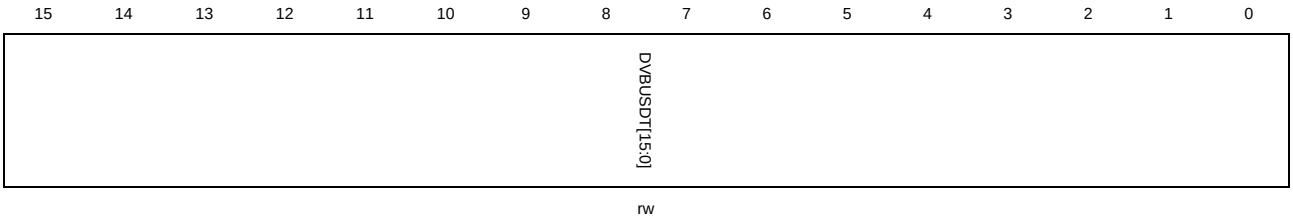
Device VBUS discharge time register (USBFS_DVBUSDT)

Address offset: 0x0828

Reset value: 0x0000 17D7

This register has to be accessed by word (32-bit)





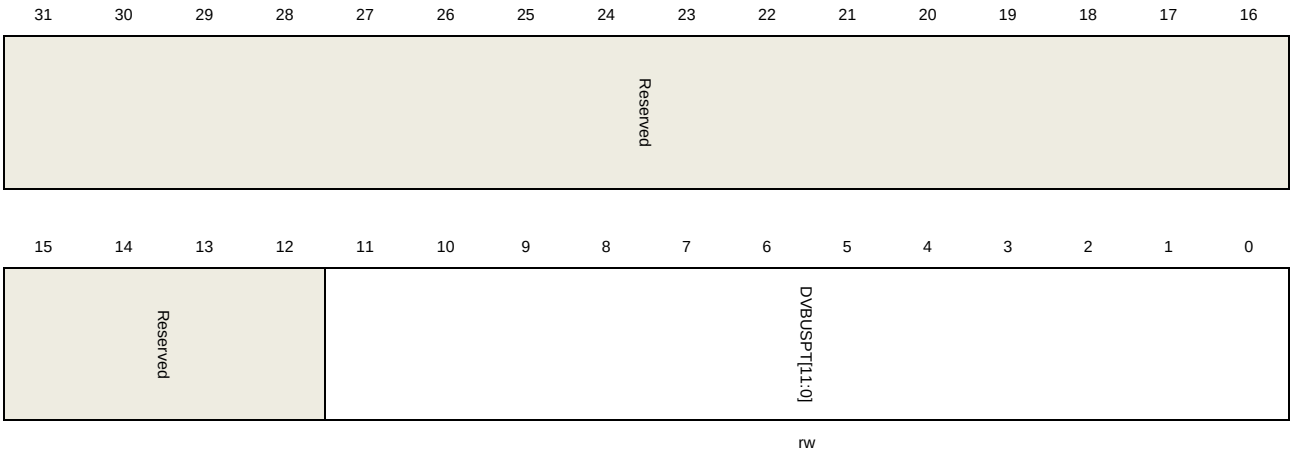
Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15:0	DVBUSDT[15:0]	Device V_{BUS} discharge time There is a discharge process after V_{BUS} pulsing in SRP protocol. This field defines the discharge time of V_{BUS}. The true discharge time is 1024 * DVBUSDT[15:0] *$T_{USBCLOCK}$, where $T_{USBCLOCK}$ is the period time of USB clock.

Device VBUS pulsing time register (USBFS_DVBUSPT)

Address offset: 0x082C

Reset value: 0x0000 05B8

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31:12	Reserved	Must be kept at reset value
11:0	DVBUSPT[11:0]	Device V_{BUS} pulsing time This field defines the pulsing time for V_{BUS}. The true pulsing time is 1024*DVBUSPT[11:0] *$T_{USBCLOCK}$, where $T_{USBCLOCK}$ is the period time of USB clock.

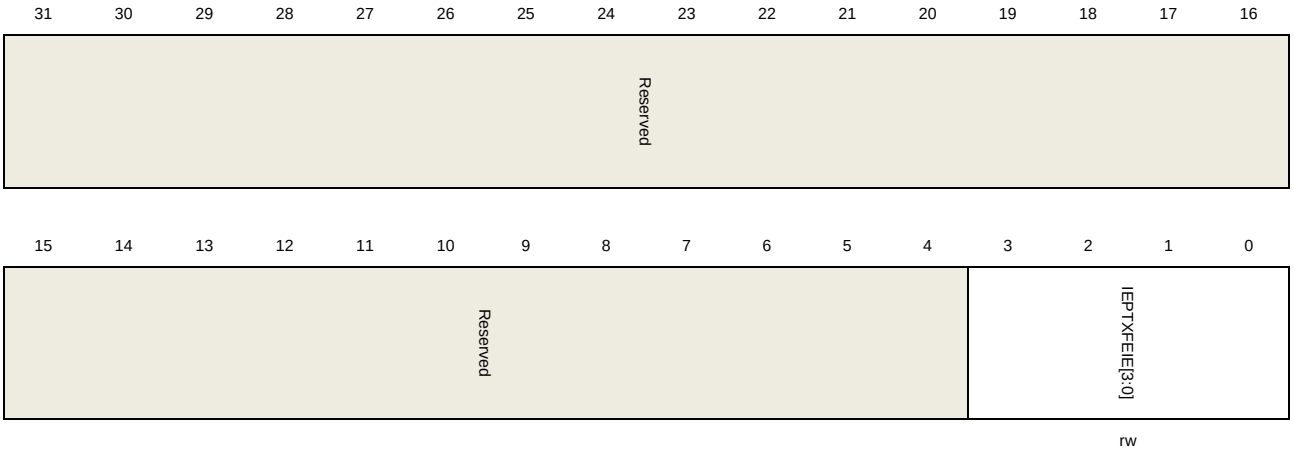
Device IN endpoint FIFO empty interrupt enable register (USBFS_DIEPFEINTEN)

Address offset: 0x0834

Reset value: 0x0000 0000

This register contains the enable bits for the Tx FIFO empty interrupts of IN endpoints.

This register has to be accessed by word (32-bit)



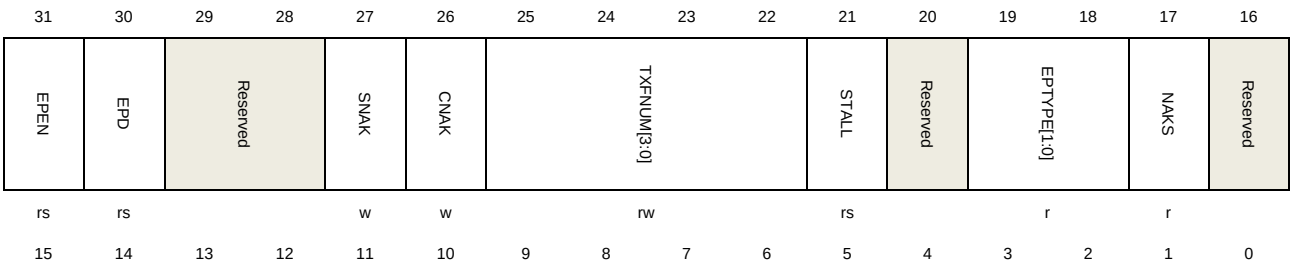
Bits	Fields	Descriptions
31:4	Reserved	Must be kept at reset value
3:0	IEPTXFEIE[3:0]	IN endpoint Tx FIFO empty interrupt enable bits This field controls whether the TXFE bits in USBFS_DIEPxINTF registers are able to generate an endpoint interrupt bit in USBFS_DAEPINT register. Bit 0 for IN endpoint 0, bit 3 for IN endpoint 3 0: Disable FIFO empty interrupt 1: Enable FIFO empty interrupt

Device IN endpoint 0 control register (USBFS_DIEP0CTL)

Address offset: 0x0900

Reset value: 0x0000 8000

This register has to be accessed by word (32-bit)



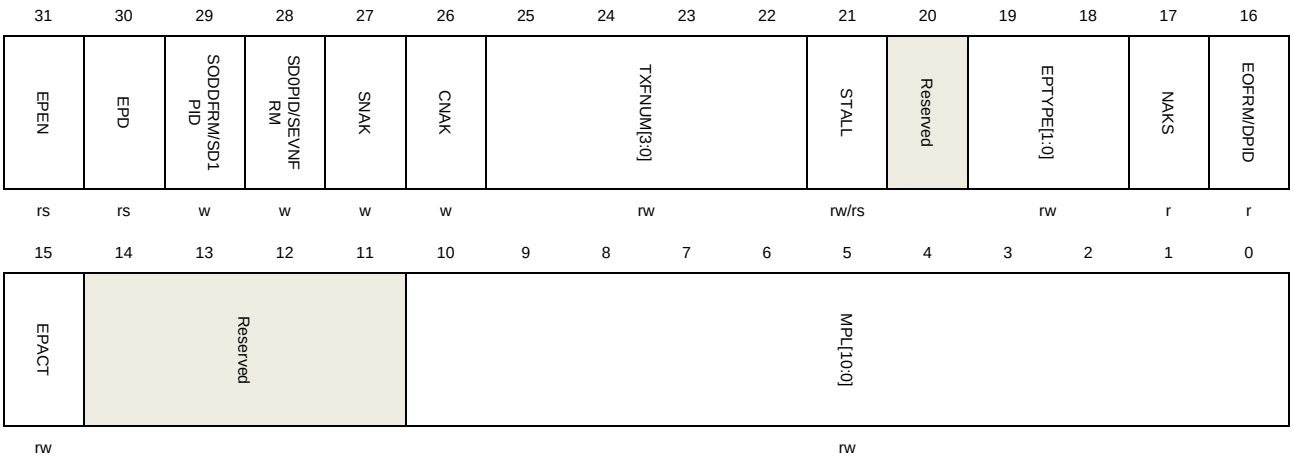
Bits	Fields	Descriptions
31	EPEN	Endpoint enable Set by the application and cleared by USBFS. 0: Endpoint disabled 1: Endpoint enabled Software should follow the operation guide to disable or enable an endpoint.
30	EPD	Endpoint disable Software can set this bit to disable the endpoint. Software should following the operation guide to disable or enable an endpoint.
29:28	Reserved	Must be kept at reset value
27	SNAK	Set NAK Software sets this bit to set NAKS bit in this register.
26	CNAK	Clear NAK Software sets this bit to clear NAKS bit in this register.
25:22	TXFNUM[3:0]	Tx FIFO number Defines the Tx FIFO number of IN endpoint 0.
21	STALL	STALL handshake Software can set this bit to make USBFS sends STALL handshake when receiving IN token. USBFS will clear this bit after a SETUP token is received on the corresponding OUT endpoint 0. This bit has a higher priority than NAKS bit in this register and GINS bit in USBFS_DCTL register. If both STALL and NAKS bits are set, the STALL bit takes effect.
20	Reserved	Must be kept at reset value
19:18	EPTYPE[1:0]	Endpoint type This field is fixed to '00' for control endpoint.
17	NAKS	NAK status This bit controls the NAK status of USBFS when both STALL bit in this register and GINS bit in USBFS_DCTL register are cleared: 0: USBFS sends data or handshake packets according to the status of the endpoint's Tx FIFO. 1: USBFS always sends NAK handshake to the IN token. This bit is read-only and software should use CNAK and SNAK in this register to

		control this bit.
16	Reserved	Must be kept at reset value
15	EPACT	Endpoint active This field is fixed to '1' for endpoint 0.
14:2	Reserved	Must be kept at reset value
1:0	MPL[1:0]	Maximum packet length This field defines the maximum packet length for a control data packet. As described in USB 2.0 protocol, there are 4 kinds of length for control transfers: 00: 64 bytes 01: 32 bytes 10: 16 bytes 11: 8 bytes

Device IN endpoint-x control register (USBFS_DIEPxCTL) (x = 1..3, where x = endpoint_number)

Address offset: 0x0900 + (endpoint_number × 0x20)
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31	EPEN	Endpoint enable Set by the application and cleared by USBFS. 0: Endpoint disabled 1: Endpoint enabled Software should follow the operation guide to disable or enable an endpoint.
30	EPD	Endpoint disable Software can set this bit to disable the endpoint. Software should following the

		operation guide to disable or enable an endpoint.
29	SODDFRM	Set odd frame (For isochronous IN endpoints) This bit has effect only if this is an isochronous IN endpoint. Software sets this bit to set EOFRM bit in this register.
	SD1PID	Set DATA1 PID (For interrupt/bulk IN endpoints) Software sets this bit to set DPID bit in this register.
28	SEVENFRM	Set even frame (For isochronous IN endpoints) Software sets this bit to clear EOFRM bit in this register.
	SD0PID	Set DATA0 PID (For interrupt/bulk IN endpoints) Software sets this bit to clear DPID bit in this register.
27	SNAK	Set NAK Software sets this bit to set NAKS bit in this register.
26	CNAK	Clear NAK Software sets this bit to clear NAKS bit in this register.
25:22	TXFNUM[3:0]	Tx FIFO number Defines the Tx FIFO number of this IN endpoint.
21	STALL	STALL handshake Software can set this bit to make USBFS sends STALL handshake when receiving IN token. This bit has a higher priority than NAKS bit in this register and GINS bit in USBFS_DCTL register. If both STALL and NAKS bits are set, the STALL bit takes effect. For control IN endpoint: Only USBFS can clear this bit when a SETUP token is received on the corresponding OUT endpoint. Software is not able to clear it. For interrupt or bulk IN endpoint: Only software can clear this bit
20	Reserved	Must be kept at reset value
19:18	EPTYPE[1:0]	Endpoint type This field defines the transfer type of this endpoint: 00: Control 01: Isochronous 10: Bulk 11: Interrupt
17	NAKS	NAK status This bit controls the NAK status of USBFS when both STALL bit in this register and GINS bit in USBFS_DCTL register are are cleared: 0: USBFS sends data or handshake packets according to the status of the endpoint's Tx FIFO.

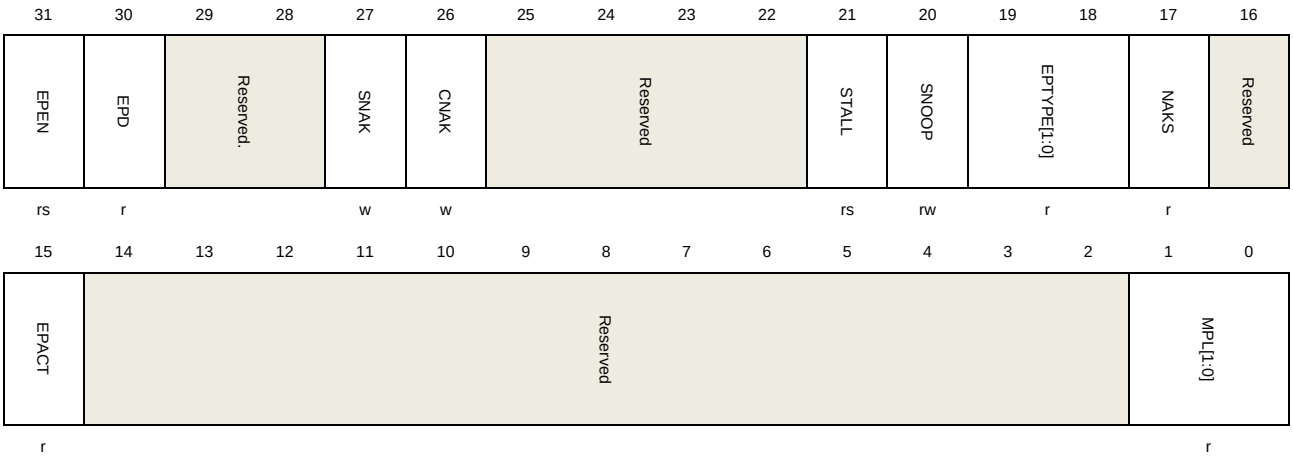
		1: USBFS always sends NAK handshake to the IN token. This bit is read-only and software should use CNAK and SNAK in this register to control this bit.
16	EOFRM	Even/odd frame (For isochronous IN endpoints) For isochronous transfers, software can use this bit to control that USBFS only sends data packets for IN tokens in even or odd frames. If the parity of the current frame number doesn't match with this bit, USBFS only responses with a zero-length packet. 0: Only sends data in even frames 1: Only sends data in odd frames
	DPID	Endpoint data PID (For interrupt/bulk IN endpoints) There is a data PID toggle scheme in interrupt or bulk transfer. Set SD0PID to set this bit before a transfer starts and USBFS maintains this bit during transfers according to the data toggle scheme described in USB protocol. 0: Data packet's PID is DATA0 1: Data packet's PID is DATA1
15	EPACT	Endpoint active This bit controls whether this endpoint is active. If an endpoint is not active, it ignores all tokens and doesn't make any response.
14:11	Reserved	Must be kept at reset value
10:0	MPL[10:0]	This field defines the maximum packet length in bytes.

Device OUT endpoint 0 control register (USBFS_DOEP0CTL)

Address offset: 0x0B00

Reset value: 0x0000 8000

This register has to be accessed by word (32-bit)



Bits	Fields	Descriptions
31	EPEN	Endpoint enable Set by the application and cleared by USBFS. 0: Endpoint disabled 1: Endpoint enabled Software should follow the operation guide to disable or enable an endpoint.
30	EPD	Endpoint disable This bit is fixed to 0 for OUT endpoint 0.
29:28	Reserved	Must be kept at reset value
27	SNAK	Set NAK Software sets this bit to set NAKS bit in this register.
26	CNAK	Clear NAK Software sets this bit to clear NAKS bit in this register
25:22	Reserved	Must be kept at reset value
21	STALL	STALL handshake Set this bit to make USBFS send STALL handshake during an OUT transaction. USBFS will clear this bit after a SETUP token is received on OUT endpoint 0. This bit has a higher priority than NAKS bit in this register, i.e. if both STALL and NAKS bits are set, the STALL bit takes effect.
20	SNOOP	Snoop mode This bit controls the snoop mode of an OUT endpoint. In snoop mode, USBFS doesn't check the received data packet's CRC value. 0: Snoop mode disabled 1: Snoop mode enabled
19:18	EPTYPE[1:0]	Endpoint type This field is fixed to '00' for control endpoint.
17	NAKS	NAK status This bit controls the NAK status of USBFS when both STALL bit in this register and GONS bit in USBFS_DCTL register are cleared: 0: USBFS sends data or handshake packets according to the status of the endpoint's Rx FIFO. 1: USBFS always sends NAK handshake for the OUT token. This bit is read-only and software should use CNAK and SNAK in this register to control this bit.
16	Reserved	Must be kept at reset value
15	EPACT	Endpoint active This field is fixed to '1' for endpoint 0.

14:2	Reserved	Must be kept at reset value
1:0	MPL[1:0]	Maximum packet length This is a read-only field, and its value comes from the MPL field of USBFS_DIEP0CTL register: 00: 64 bytes 01: 32 bytes 10: 16 bytes 11: 8 bytes

Device OUT endpoint-x control register (USBFS_DOEPxCTL) (x = 1..3, where x = endpoint_number)

Address offset: 0x0B00 + (endpoint_number × 0x20)
Reset value: 0x0000 0000

The application uses this register to control the operations of each logical OUT endpoint other than OUT endpoint 0.

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EPEN	EPD	SODDFRM/SD1PID	SEVNFRM/SD0PID	SNAK	CNAK	Reserved				STALL	SNOOP	EPTYPE[1:0]		NAKS	EOFRM/DPID
rs	rs	w	w	w	w					rw/rs	rw	rw		r	r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EPACT	Reserved				MPL[10:0]										
rw					rw										

Bits	Fields	Descriptions
31	EPEN	Endpoint enable Set by the application and cleared by USBFS. 0: Endpoint disabled 1: Endpoint enabled Software should follow the operation guide to disable or enable an endpoint.
30	EPD	Endpoint disable Software can set this bit to disable the endpoint. Software should follow the operation guide to disable or enable an endpoint.
29	SODDFRM	Set odd frame (For isochronous OUT endpoints)

		This bit has effect only if this is an isochronous OUT endpoint. Software sets this bit to set EOFRM bit in this register.
	SD1PID	Set DATA1 PID (For interrupt/bulk OUT endpoints) Software sets this bit to set DPID bit in this register.
28	SEVENFRM	Set even frame (For isochronous OUT endpoints) Software sets this bit to clear EOFRM bit in this register.
	SD0PID	Set DATA0 PID (For interrupt/bulk OUT endpoints) Software sets this bit to clear DPID bit in this register.
27	SNAK	Set NAK Software sets this bit to set NAKS bit in this register.
26	CNAK	Clear NAK Software sets this bit to clear NAKS bit in this register.
25:22	Reserved	Must be kept at reset value
21	STALL	STALL handshake Software can set this bit to make USBFS sends STALL handshake during an OUT transaction. This bit has a higher priority than NAKS bit in this register and GINAK in USBFS_DCTL register. If both STALL and NAKS bits are set, the STALL bit takes effect. For control OUT endpoint: Only USBFS can clear this bit when a SETUP token is received on the corresponding OUT endpoint. Software is not able to clear it. For interrupt or bulk OUT endpoint: Only software can clear this bit.
20	SNOOP	Snoop mode This bit controls the snoop mode of an OUT endpoint. In snoop mode, USBFS doesn't check the received data packet's CRC value. 0: Snoop mode disabled 1: Snoop mode enabled
19:18	EPTYPE[1:0]	Endpoint type This field defines the transfer type of this endpoint: 00: Control 01: Isochronous 10: Bulk 11: Interrupt
17	NAKS	NAK status This bit controls the NAK status of USBFS when both STALL bit in this register and GONS bit in USBFS_DCTL register are cleared: 0: USBFS sends handshake packets according to the status of the endpoint's Rx

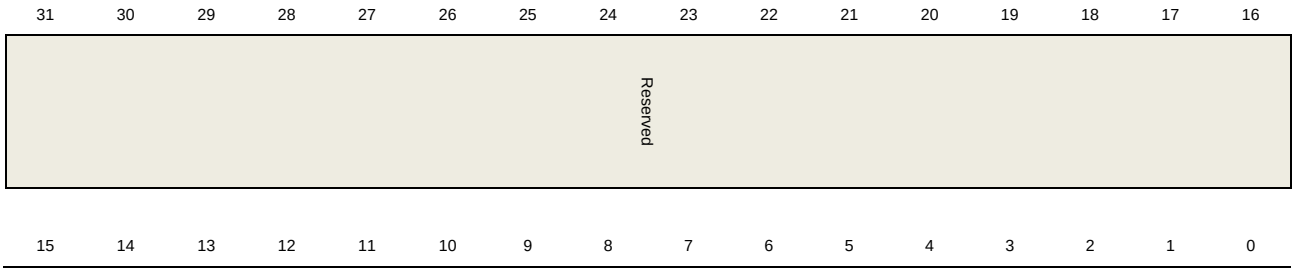
		FIFO. 1: USBFS always sends NAK handshake to the OUT token. This bit is read-only and software should use CNAK and SNAK in this register to control this bit.
16	EOFRM	Even/odd frame (For isochronous OUT endpoints) For isochronous transfers, software can use this bit to control that USBFS only receives data packets in even or odd frames. If the current frame number's parity doesn't match with this bit, USBFS just drops the data packet. 0: Only sends data in even frames 1: Only sends data in odd frames
	DPID	Endpoint data PID (For interrupt/bulk OUT endpoints) These is a data PID toggle scheme in interrupt or bulk transfer. Software should set SD0PID to set this bit before a transfer starts and USBFS maintains this bit during transfers following the data toggle scheme described in USB protocol. 0: Data packet's PID is DATA0 1: Data packet's PID is DATA1
15	EPACT	Endpoint active This bit controls whether this endpoint is active. If an endpoint is not active, it ignores all tokens and doesn't make any response.
14:11	Reserved	Must be kept at reset value
10:0	MPL[10:0]	This field defines the maximum packet length in bytes.

Device IN endpoint-x interrupt flag register (USBFS_DIEPxINTF) (x = 0..3, where x = endpoint_number)

Address offset: 0x0908 + (endpoint_number × 0x20)
Reset value: 0x0000 0080

This register contains the status and events of an IN endpoint, when an IN endpoint interrupt occurs, read this register for the respective endpoint to know the source of the interrupt. The flag bits in this register are all set by hardware and cleared by writing 1 except the read-only TXFE bit.

This register has to be accessed by word (32-bit)



Reserved	TXFE	IEPNE	Reserved	EPTXFUD	CITO	Reserved	EPDIS	TF
	r	rc_w1		rc_w1	rc_w1		rc_w1	rc_w1

Bits	Fields	Descriptions
31:8	Reserved	Must be kept at reset value
7	TXFE	Transmit FIFO empty The Tx FIFO of this IN endpoint has reached the empty threshold value defined by TXFTH field in USBFS_GAHBCS register.
6	IEPNE	IN endpoint NAK effective The setting of SNAK bit in USBFS_DIEPxCTL register takes effect. This bit can be cleared either by writing 1 to it or by setting CNAK bit in USBFS_DIEPxCTL register.
5	Reserved	Must be kept at reset value
4	EPTXFUD	Endpoint Tx FIFO underrun This flag is triggered if the Tx FIFO has no packet data when an IN token is incoming
3	CITO	Control IN Timeout interrupt This flag is triggered if the device waiting for a handshake is timeout in a control IN transaction.
2	Reserved	Must be kept at reset value
1	EPDIS	Endpoint disabled This flag is triggered when an endpoint is disabled by the software's request.
0	TF	Transfer finished This flag is triggered when all the IN transactions assigned to this endpoint have been finished.

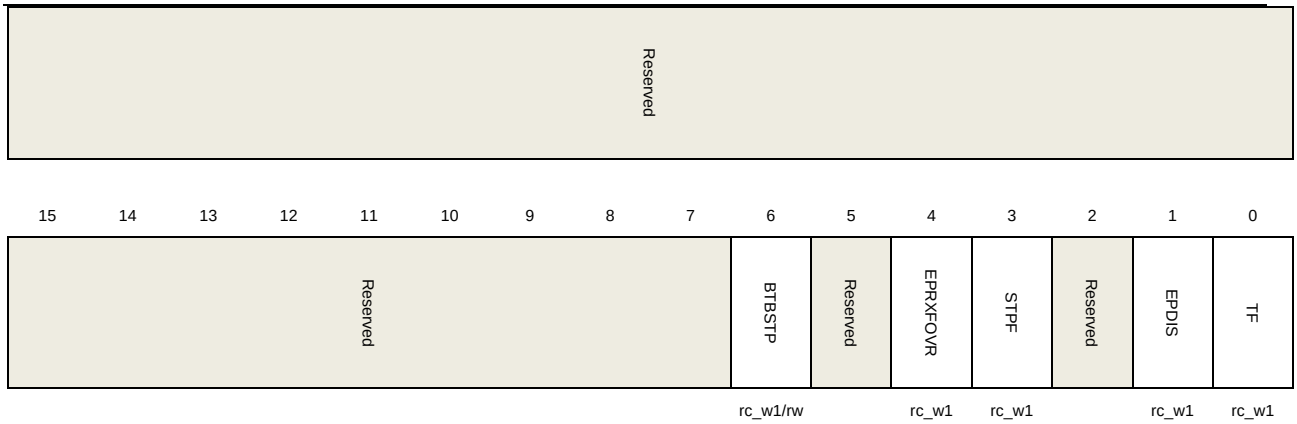
Device OUT endpoint-x interrupt flag register (USBFS_DOEPxINTF) (x = 0..3, where x = endpoint_number)

Address offset: 0x0B08 + (endpoint_number × 0x20)
Reset value: 0x0000 0000

This register contains the status and events of an OUT endpoint, when an OUT endpoint interrupt occurs, read this register for the respective endpoint to know the source of the interrupt. The flag bits in this register are all set by hardware and cleared by writing 1.

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16



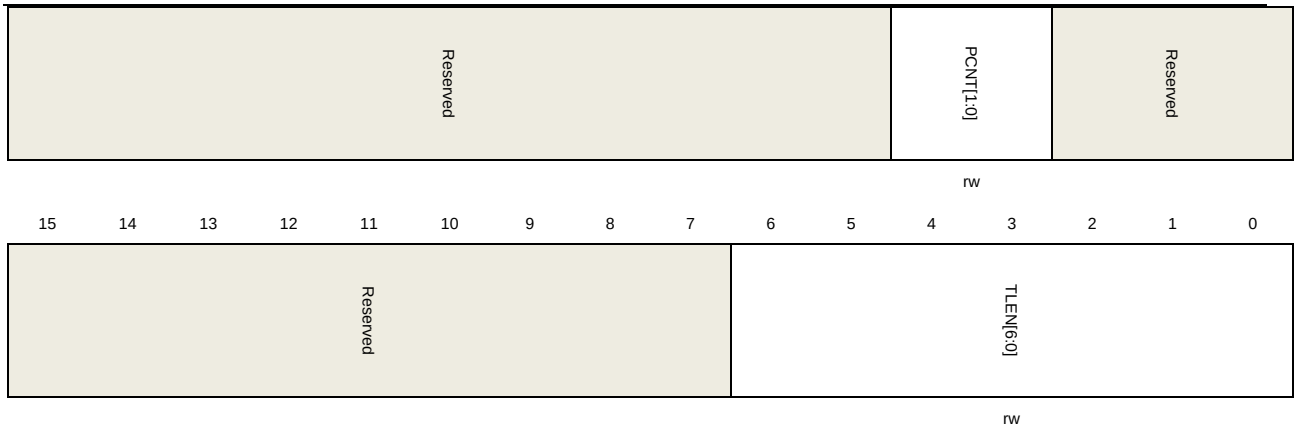
Bits	Fields	Descriptions
31:7	Reserved	Must be kept at reset value
6	BTBSTP	Back-to-back SETUP packets (Only for control OUT endpoint) This flag is triggered when a control out endpoint has received more than 3 back-to-back setup packets.
5	Reserved	Must be kept at reset value
4	EPRXFOVR	Endpoint Rx FIFO overrun This flag is triggered if the OUT endpoint's Rx FIFO has no enough space for a packet data when an OUT token is incoming. USBFS will drop the incoming OUT data packet and sends a NAK handshake in this case.
3	STPF	SETUP phase finished (Only for control OUT endpoint) This flag is triggered when a setup phase finished, i.e. USBFS receives an IN or OUT token after a setup token.
2	Reserved	Must be kept at reset value
1	EPDIS	Endpoint disabled This flag is triggered when an endpoint is disabled by the software's request.
0	TF	Transfer finished This flag is triggered when all the OUT transactions assigned to this endpoint have been finished.

Device IN endpoint 0 transfer length register (USBFS_DIEP0LEN)

Address offset: 0x0910

Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

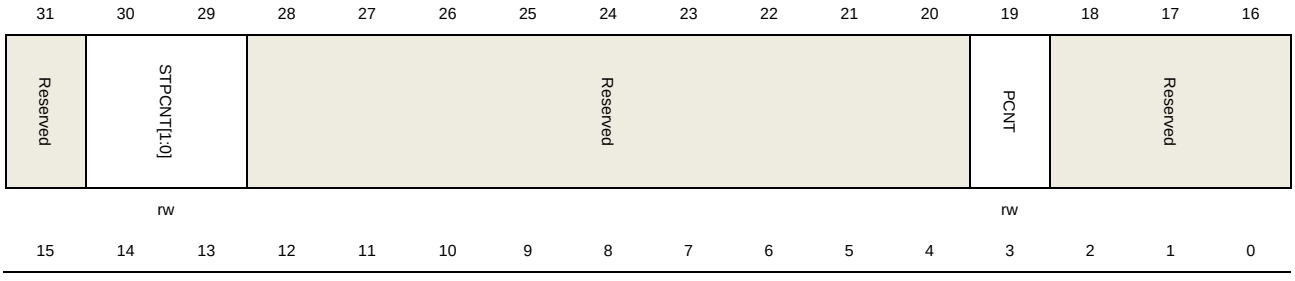


Bits	Fields	Descriptions
31:21	Reserved	Must be kept at reset value
20:19	PCNT[1:0]	Packet count The number of data packets desired to be transmitted in a transfer. Program this field before the endpoint is enabled. After the transfer starts, this field is decreased automatically by USBFS after each successful data packet transmission.
18:7	Reserved	Must be kept at reset value
6:0	TLEN[6:0]	Transfer length The total data byte number of a transfer. This field is the total data bytes of all the data packets desired to be transmitted in an IN transfer. Program this field before the endpoint is enabled. When software successfully writes a packet into the endpoint's Tx FIFO, this field is decreased by the byte size of the packet.

Device OUT endpoint 0 transfer length register (USBFS_DOEP0LEN)

Address offset: 0x0B10
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



Reserved	TLEN[6:0]
	rw

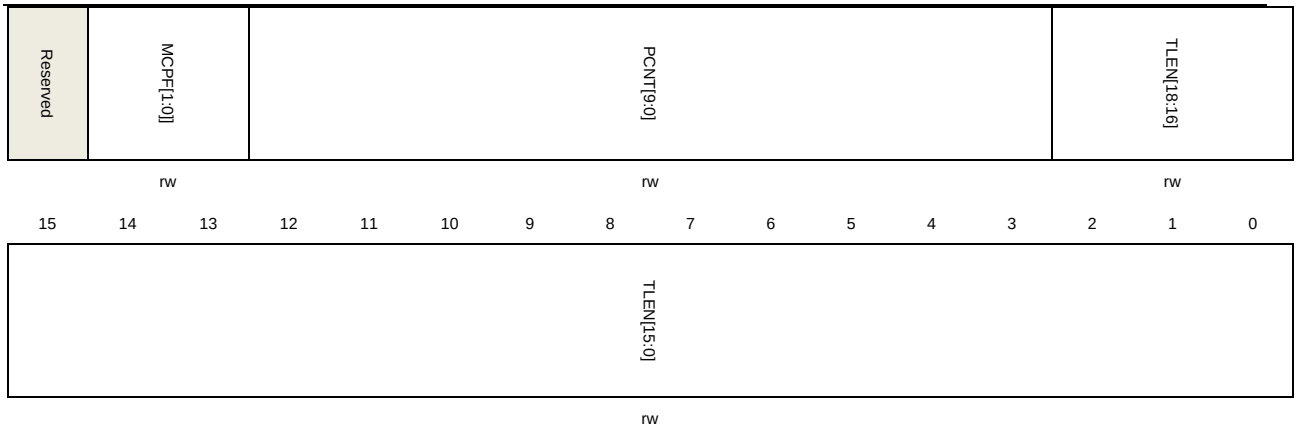
Bits	Fields	Descriptions
31	Reserved	Must be kept at reset value
30:29	STPCNT[1:0]	SETUP packet count This field defines the maximum number of back-to-back SETUP packets this endpoint can accept. Program this field before setup transfers. Each time a back-to-back setup packet is received, USBFS decrease this field by one. When this field reaches zero, the BTBSTP flag in USBFS_DOEP0INTF register will be triggered. 00: 0 packet 01: 1 packet 10: 2 packets 11: 3 packets
28:20	Reserved	Must be kept at reset value
19	PCNT	Packet count The number of data packets desired to receive in a transfer. Program this field before the endpoint is enabled. After the transfer starts, this field is decreased automatically by USBFS after each successful data packet reception on bus.
18:7	Reserved	Must be kept at reset value
6:0	TLEN[6:0]	Transfer length The total data byte number of a transfer. This field is the total data bytes of all the data packets desired to receive in an OUT transfer. Program this field before the endpoint is enabled. Each time software reads out a packet from the Rx FIFO, this field is decreased by the byte size of the packet.

Device IN endpoint-x transfer length register (USBFS_DIEPxLEN) (x = 1..3, where x = endpoint_number)

Address offset: 0x910 + (endpoint_number × 0x20)
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

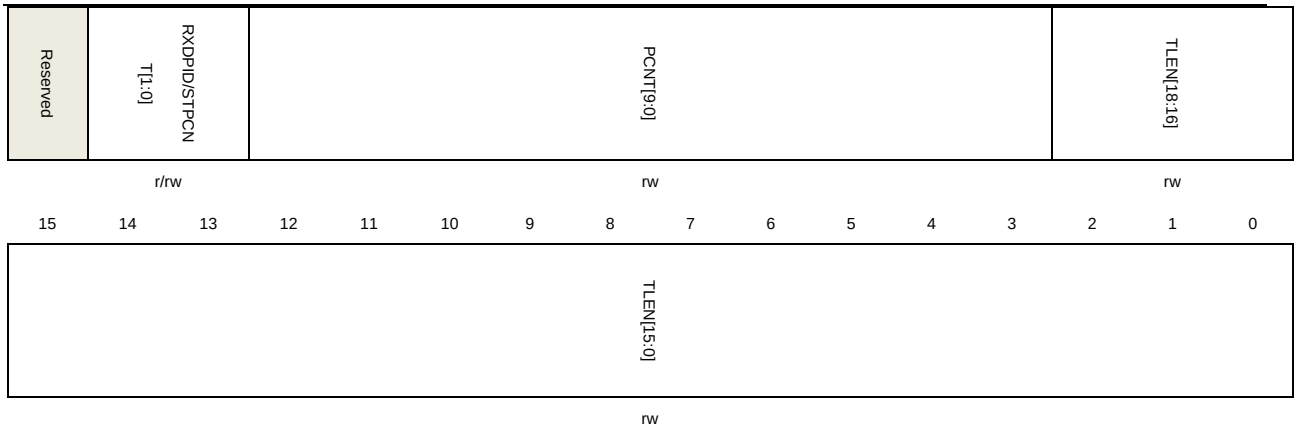


Bits	Fields	Descriptions
31	Reserved	Must be kept at reset value
30:29	MCPF[1:0]	Multi packet count per frame This field indicates the packet count that must be transmitted per frame for periodic IN endpoints on the USB. It is used to calculate the data PID for isochronous IN endpoints by the core. 01: 1 packet 10: 2 packets 11: 3 packets
28:19	PCNT[9:0]	Packet count The number of data packets desired to be transmitted in a transfer. Program this field before the endpoint is enabled. After the transfer starts, this field is decreased automatically by USBFS after each successful data packet transmission.
18:0	TLEN[18:0]	Transfer length The total data byte number of a transfer. This field is the total data bytes of all the data packets desired to be transmitted in an IN transfer. Program this field before the endpoint is enabled. When software successfully writes a packet into the endpoint's Tx FIFO, this field is decreased by the byte size of the packet.

Device OUT endpoint-x transfer length register (USBFS_DOEPxLEN) (x = 1..3, where x = endpoint_number)

Address offset: 0x0B10 + (endpoint_number × 0x20)
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)



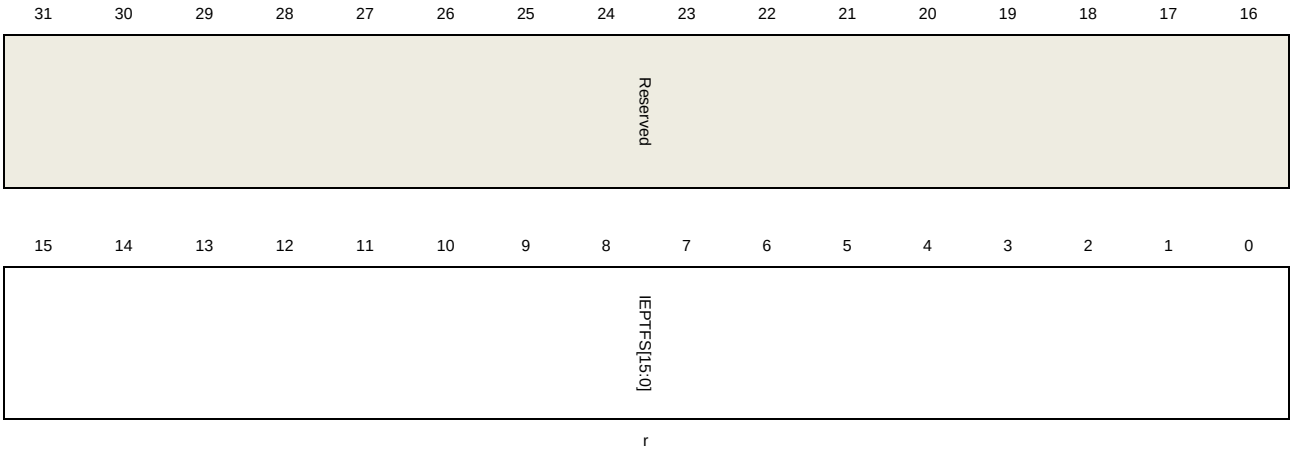
Bits	Fields	Descriptions
31	Reserved	Must be kept at reset value
30:29	RXDPID[1:0]	Received data PID (For isochronous OUT endpoints) This field saves the PID of the latest received data packet on this endpoint. 00: DATA0 10: DATA1 Others: Reserved
	STPCNT[1:0]	SETUP packet count (For control OUT Endpoints.) This field defines the maximum number of back-to-back SETUP packets this endpoint can accept. Program this field before setup transfers. Each time a back-to-back setup packet is received, USBFS decrease this field by one. When this field reaches zero, the BTBSTP flag in USBFS_DOEPxINTF register will be triggered. 00: 0 packet 01: 1 packet 10: 2 packets 11: 3 packets
28:19	PCNT[9:0]	Packet count The number of data packets desired to receive in a transfer. Program this field before the endpoint is enabled. After the transfer starts, this field is decreased automatically by USBFS after each successful data packet reception on bus.
18:0	TLEN[18:0]	Transfer length The total data byte number of a transfer. This field is the total data bytes of all the data packets desired to receive in an OUT transfer. Program this field before the endpoint is enabled. Each time after software reads out a packet from the RxFIFO, this field is decreased by the byte size of the packet.

Device IN endpoint-x transmit FIFO status register (USBFS_DIEPxTFSTAT) (x = 0..3, where x = endpoint_number)

Address offset: 0x0918 + (endpoint_number × 0x20)
Reset value: 0x0000 0200

This register contains the information of each endpoint's Tx FIFO.

This register has to be accessed by word (32-bit)

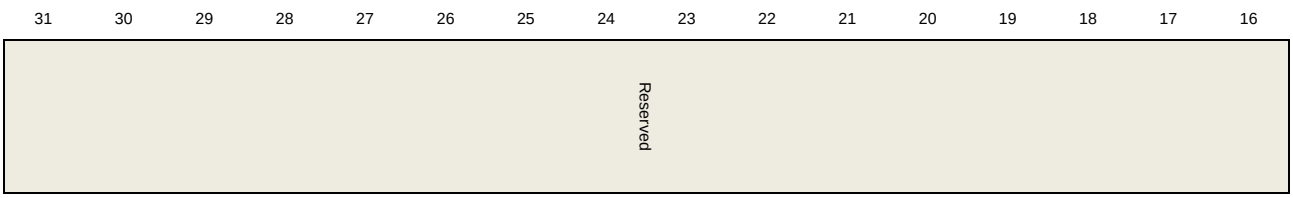


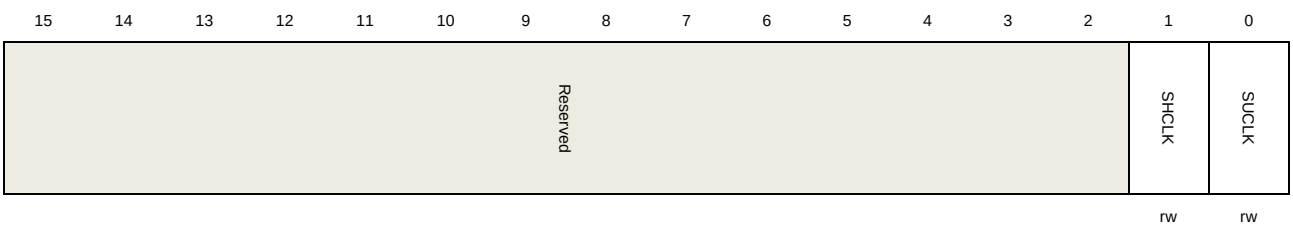
Bits	Fields	Descriptions
31:16	Reserved	Must be kept at reset value
15:0	IEPTFS[15:0]	IN endpoint's Tx FIFO space remaining I N endpoint's Tx FIFO space remaining in 32-bit words: 0: FIFO is full 1: 1 word available … n: n words available

21.7.4. Power and clock control register (USBFS_PWRCLKCTL)

Address offset: 0x0E00
Reset value: 0x0000 0000

This register has to be accessed by word (32-bit)





Bits	Fields	Descriptions
31:2	Reserved	Must be kept at reset value
1	SHCLK	Stop HCLK Stop the HCLK to save power. 0: HCLK is not stopped 1: HCLK is stopped
0	SUCLK	Stop the USB clock Stop the USB clock to save power. 0: USB clock is not stopped 1: USB clock is stopped

22. Appendix

22.1. List of abbreviations used in register

Table 22-1. List of abbreviations used in register

abbreviations for registers	Descriptions
read/write (rw)	Software can read and write to this bit.
read-only (r)	Software can only read this bit.
write-only (w)	Software can only write to this bit. Reading this bit returns the reset value.
read/clear write 1 (rc_w1)	Software can read as well as clear this bit by writing 1. Writing 0 has no effect on the bit value.
read/clear write 0 (rc_w0)	Software can read as well as clear this bit by writing 0. Writing 1 has no effect on the bit value.
toggle (t)	The software can toggle this bit by writing 1. Writing 0 has no effect.
read/set (rs)	Software can read as well as set this bit to 1. Writing '0' has no effect on the bit value.
read/clear by read (rc_r)	Software can read this bit. Reading this bit automatically clears it to '0'. Writing '0' has no effect on the bit value.

22.2. List of terms

Table 22-2. List of terms

Glossary	Descriptions
Word	Data of 32-bit length.
Half-word	Data of 16-bit length.
Byte	Data of 8-bit length.
IAP (in-application programming)	Writing 0 has no effect IAP is the ability to re-program the Flash memory of a microcontroller while the user program is running.
ICP (in-circuit programming)	ICP is the ability to program the Flash memory of a microcontroller using the JTAG protocol, the SWD protocol or the boot loader while the device is mounted on the user application board.
Option bytes	Product configuration bits stored in the Flash memory.
AHB	Advanced high-performance bus.
APB	Advanced peripheral bus.
RAZ	Read-as-zero.
WI	Writes ignored.
RAZ/WI	Read-as-zero, writes ignored.

22.3. Available peripherals

For availability of peripherals and their number across all MCU series types, refer to the corresponding device data datasheet.

23. Revision history

Table 23-1. Revision history

Revision No.	Description	Date
1.0	Initial Release	Jun.5, 2019
1.1	1. Modify description about ADC, DAC, VREF in chapter 3.3.2. 2. Add decription of fast mode plus function and Fast mode plus configure register (I2C_FMPCFG) in chapter 17. 3. Modify the value of POR and PDR according to the latest electrical parameters of the datasheet in chapter 3.3.2	Oct.8, 2019
1.2	1. Modify the value of POR, PDR, Vhyst and the table 3-2 in chapter 3.3.2. 2. Modify the range of HXTAL to 4~32MHz and the clock tree in chapter RCU. 3. Modify 010 to 100 in table 7-3. 4. Modify RISC-V JTAG IR 4-bit width to 5-bit width in chapter 10.2.2.	Oct.30, 2019
1.3	1. Modify the calculation formula of ***Baud rate*** in CAN module. 2. Modify the size of SRAM in ***Table 1 2. Memory map of GD32VF103 devices***. 3. Add description content in chapter ***ADCON***. 4. Modify 0.2V in "if VDDA is different from VDD, VDDA must always be higher, but the voltage difference should not exceed 0.2V" to 0.3V in chapter ***VDDA domain***. 5. Modify 16 HCLK to 12 HCLK in ***USB host function***. 6. Add the description of "Just for CAN0" for register of filter in chapter 20.4.17-20.4.22. ***7.*** Modify the description of SMBALT bit filed in ***Transfer status register 0 (I2C_STAT0)***. 8. Delete RTC timestamp event and RTC tamper event in chapter ***Power saving modes*** and in chapter ***Control and status register (PMU_CS)***.	Jun.24, 2021
1.4	1. Modify ***Table 13-1. Min/max FWDGT timeout period at 40 kHz (IRC40K)***. 2. Modify description in chapter ***Programmable resolution***	Jun.16, 2022

	(DRES). 3. Modify the description of ADDSEND bit in ***Transfer status register 0 (I2C_STAT0)*** and MASTER bit in ***Transfer status register 1 (I2C_STAT1)***.	
1.5	1. Modify description“if VDDA is different from VDD, VDDA must always be higher, but the voltage difference should not exceed 0.3V.” to “when the VDD and VDDA are provided by different power supplies, the difference between VDD and VDDA during power-up and running time should not exceed 0.3V.” in chapter 3.3.2 ***VDDA domain***. 2. Change I2SSTDSEL to I2SSTD in figure Figure ***18 50. I2S master reception disabling sequence***. 3. Change “If any register configuration operations occur, the DMA will restart a new transmission” to “If any register configuration operations to DMA_CHxCNT, DMA_CHxPADDR or DMA_CHxMADDR of corresponding channel occur, the DMA will restart a new transmission” in chapter 9.4.1.	Jun.20, 2022
1.6	1. Change “I2SSTDSEL” to “I2SSTD” in Firgure18-50 2. Added the description” If Channel0 is set to input mode, this bit will be reset by reading TIMERx_CH0CV” in register bit CH0IF in the TIMER section. 3. Correct spelling mistakes in GPIO and SPIsection.	Jul 10, 2024
1.7	1. Modify description in ***Table 11-2. ADC input pins definition*** 2. Change “CAM = 2b’10” to “CAM = 2b’01” in ***Figure 15-8. Timing chart of center-aligned counting mode*** and ***Figure 15-37. Timing chart of center-aligned counting mode*** 3. Change “DAC” to “DAC0” in ***Figure 1-1. GD32VF103 system architecture*** and ***Table 1-2. Memory map of GD32VF103 devices***	Feb 11, 2025
1.8	1. Modify the description of the half-duplex mode of the USART peripheral 2. The SMBus timeout in I2C peripherals has been changed from 35ms to 25ms. 3. Add description “Note: The configuration value of the I2S serial clock must be set to less than 1/6 of the PCLK clock (excluding 1/6)” in 18.4.4 chapter.	Aug 8, 2025

Any information provided in this document is provided only for reference purposes. It is the sole responsibility of the user of this document to determine whether the Product is suitable and fit for its applications and products planned, and properly design, program, and test the functionality and safety of its applications and products planned using the Product. The Product is designed, developed, and/or manufactured for ordinary business, industrial, personal, and/or household applications only, and the Product is not designed or intended for use in (i) safety critical applications such as weapons systems, nuclear facilities, atomic energy controller, combustion controller, aeronautic or aerospace applications, traffic signal instruments, pollution control or hazardous substance management; (ii) life-support systems, other medical equipment or systems (including life support equipment and surgical implants); (iii) automotive applications or environments, including but not limited to applications for active and passive safety of automobiles (regardless of front market or aftermarket), for example, EPS, braking, ADAS (camera/fusion), EMS, TCU, BMS, BSG, TPMS, Airbag, Suspension, DMS, ICMS, Domain, ESC, DCDC, e-clutch, advanced-lighting, etc.. Automobile herein means a vehicle propelled by a self-contained motor, engine or the like, such as, without limitation, cars, trucks, motorcycles, electric cars, and other transportation devices; and/or (iv) other uses where the failure of the device or the Product can reasonably be expected to result in personal injury, death, or severe property or environmental damage (collectively "Unintended Uses"). Customers shall take any and all actions to ensure the Product meets the applicable laws and regulations. The Company is not liable for, in whole or in part, and customers shall hereby release the Company as well as its suppliers and/or distributors from, any claim, damage, or other liability arising from or related to all Unintended Uses of the Product. Customers shall indemnify and hold the Company, and its officers, employees, subsidiaries, affiliates as well as its suppliers and/or distributors harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of the Product.

Information in this document is provided solely in connection with the Product. The Company reserves the right to make changes, corrections, modifications or improvements to this document and the Product described herein at any time without notice. The Company shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
